If not that, the exam dumps of are committed to make your exam preparing much less hassle-free and smooth. For that goal the Realdumps retains on updating the braindumps questions based on every single update with the real exam. The exam dumps questions with free updates of real exam are sort of a beast for the preparing of new questions. You will under no circumstances get the chance to skip on nearly anything over this exam questions.

But that is not it, the exam dumps of Realdumps provide you the best chance to prosper inside your exam questions planning as being the exam dumps of Realdumps are increasingly being curated from the specialists. Those marketplace professionals have put their experience and all knowledge in these exams. So, we can easily certainly say that exam dumps are one of the top-rated and top sources for the planning of the exam questions which is not any joke. The exam dumps questions provide the highest passing fee amid each of the preparation product, and you also can vet that actuality by undergoing the testimonials of exam dumps in which you can find the various beneficial reviews about the exam dumps.

Not merely this the exam dumps of Realdumps can be attained using the 100% a reimbursement warranty, earning your financial commitment best secure. But which is not all, the exam dumps of Realdumps also have the 24/7 customer assist about the exam dumps, this will make the exam dumps questions a well-known resource for that preparing of exam questions. In brief the exam dumps questions of Realdumps must be your experience gate for your preparation of new questions.

In case you didn't have the authentic exam study material to prepare for the exam then make use of the exam dumps 2022. So, quickly prepare with exam dumps that is the productive process of preparation, validate your capabilities and prepare for the exam. Almost everything is attested by the expert, and with sophisticated solutions of preparation, you will be capable to pass your exam questions. The exam dumps 2022 are the genuine source of preparation and you can achieve your tasks extremely properly. You can successfully obtain the most beneficial outcomes by the exam dumps.

P.S. Free 2025 VMware 3V0-41.22 dumps are available on Google Drive shared by Prep4pass: https://drive.google.com/open?id=1t_SUNDDDe28mBTvJko02pB3_3AM_EGRSE

Despite the complex technical concepts, our 3V0-41.22 exam questions have been simplified to the level of average candidates, posing no hurdles in understanding the various ideas. It is also the reason that our 3V0-41.22 study guide is famous all over the world. We also have tens of thousands of our loyal customers who support us on the 3V0-41.22 Learning Materials. Just look at the feedbacks on our website, they all praised our 3V0-41.22 practice engine.

VMware 3V0-41.22 exam is an advanced-level certification exam designed to test the skills and knowledge of professionals who are looking to deploy VMware NSX-T Data Center 3.X. 3V0-41.22 exam covers a wide range of topics, including NSX-T architecture, installation and configuration, security, network virtualization, and more. It is intended for experienced professionals who have a deep understanding of VMware products and technologies and are proficient in network and security concepts.

VMware 3V0-41.22 certification exam covers various topics such as NSX-T Data Center architecture, installation and configuration, network virtualization, and security features. 3V0-41.22 exam is designed to test the candidate's knowledge and skills in deploying NSX-T Data Center in a multi-site environment, integrating with third-party services, and troubleshooting common issues. Advanced Deploy VMware NSX-T Data Center 3.X certification is intended for IT professionals who are responsible for designing, deploying, and managing NSX-T Data Center environments in their organizations. By passing this certification exam, the candidate can demonstrate their expertise in advanced deployment of NSX-T Data Center and enhance their career prospects in the field of network virtualization and security.

VMware 3V0-41.22 Certification is a valuable asset for IT professionals who want to advance their careers in network virtualization and cloud computing. It demonstrates the candidate's proficiency in deploying and managing advanced NSX-T features, which are essential for modern data centers. Advanced Deploy VMware NSX-T Data Center 3.X certification also enhances the candidate's credibility and marketability, making them more attractive to potential employers.

VMware 3V0-41.22 Practice Test - Latest Preparation Material [2025]

The Prep4pass is committed from the day first to ace the Advanced Deploy VMware NSX-T Data Center 3.X (3V0-41.22) exam questions preparation at any cost. To achieve this objective Prep4pass has hired a team of experienced and qualified VMware 3V0-41.22 certification exam experts. They utilize all their expertise to offer top-notch Advanced Deploy VMware NSX-T Data Center 3.X (3V0-41.22) exam dumps. These 3V0-41.22 exam questions are being offered in three different but easy-to-use formats.

VMware Advanced Deploy VMware NSX-T Data Center 3.X Sample Questions (Q15-Q20):

NEW QUESTION # 15

Task 13

You have been asked to configure the NSX backups for the environment so that if the NSX Manager fails it can be restored with the same IP address to the original primary Data Center that is in an Active / Standby configuration. Backups should be scheduled to run once every 24 hours as well as when there are changes published to the NSX environment. Ensure that backups are completed on their respective environment. Verify the backup file has been created on the SFTP server.

* Credentials needed to complete the task:

SFTP User:	sftpuser
Password:	VMware!!
SFTP IP:	192.168.110.91
Hostname:	ubuntu-01.corp.local

You need to:

- * Verify that an SFTP server is available on the network and obtain SFTP Fingerprint.
- * Configure NSX Backups via NSX Appliance Backup
- * Configure Scheduling Criteria

Backup Configuration Criteria

Backup Schedule:	Once backup per 24 hours
Additional Backup Triggers:	Detect NSX configuration (5 min time interval)
Primary Data Center Configuration:	Active / Standby
Backup locations:	All backups on respective NSX environment
Additional Notes:	NSX Manager shall be restored with same IP address
Directory Path:	/data
Passphrase:	VMware!!

Complete the requested task.

Notes: Passwords are contained in the user_readme.txt. This task is not dependent on other tasks. This task should take approximately 15 minutes to complete.

Answer:

Explanation:

See the Explanation part of the Complete Solution and step by step instructions.

Explanation

To configure the NSX backups for the environment, you need to follow these steps:

Verify that an SFTP server is available on the network and obtain SFTP fingerprint. You can use the `search_web("SFTP server availability")` tool to find some information on how to set up and check an SFTP server. You can also use the `ssh-keyscan` command to get the fingerprint of the SFTP server. For example, `ssh-keyscan -t ecdsa sftp_server` will return the ECDSA key of the `sftp_server`. You can compare this key with the one displayed on the NSX Manager UI when you configure the backup settings. Configure NSX Backups via NSX Appliance Backup. Log in to the NSX Manager UI with admin credentials. The default URL is `https://<nsx-manager-ip-address>`. Select System > Lifecycle Management > Backup & Restore. Click Edit under the SFTP Server label to configure your SFTP server. Enter the FQDN or IP address of the backup file server, such as 10.10.10.100. The protocol text box is already filled in. SFTP is the only supported protocol. Change the default port if necessary. The default TCP port is 22. In the Directory Path text box, enter the absolute directory path where the backups will be stored, such as /data. The directory must already exist and cannot be the root directory (/). Avoid using path drive letters or spaces in directory names; they are not supported. In the Passphrase text box, enter a passphrase that will be used to encrypt and decrypt the backup files, such as VMware!.

Click Save to create the backup configuration.

Configure Scheduling Criteria. On the Backup & Restore page, click Edit under the Schedule label to configure your backup schedule. Select Enabled from the drop-down menu to enable scheduled backups.

Select Daily from the Frequency drop-down menu to run backups once every 24 hours. Select a time from the Time drop-down menu to specify when the backup will start, such as 12:00 AM. Select Enabled from the Additional Backup Trigger drop-down menu to run backups when there are changes published to the NSX environment. Click Save to create the backup schedule. Verify that a backup file has been created on the SFTP server. On the Backup & Restore page, click Start Backup to run a manual backup and verify that it completes successfully. You should see a message saying "Backup completed successfully". You can also check the status and details of your backups on this page, such as backup size, duration, and timestamp. Alternatively, you can log in to your SFTP server and check if there is a backup file in your specified directory path, such as /data.

NEW QUESTION # 16

Task 1

You are asked to prepare a VMware NSX-T Data Center ESXi compute cluster Infrastructure. You will prepare two ESXi servers in a cluster for NSX-T overlay and VLAN use.

All configuration should be done using the NSX UI.

* NOTE: The configuration details in this task may not be presented to you in the order in which you must complete them.

* Configure a new Transport Node profile and add one n-VDS switch. Ensure Uplink1 and Uplink 2 of your configuration use vmnic2 and vmnic3 on the host.

Configuration detail:

Name:	RegionA01-COMP01-TNP
Type:	n-VDS switch
Mode:	standard
n-VDS Switch Name:	N-VDS-1
Transport Zones:	TZ-Overlay-1 and TZ-VLAN-1
NIOC profile:	nsx-default-nioc-hostswitch-profile
Uplink Profile:	RegionA01-COMP01-UP
LLDP Profile:	LLDP [send packet disabled]
IP Assignment:	TEP-Pool-02

Hint: The Transport Zone configuration will be used by another administrator at a later time.

- Configure a new VLAN backed transport zone.

Configuration detail:

- Configure a new uplink profile for the ESXi servers.

Configuration detail:

Name:	RegionA01-COMP01-UP
Teaming Policy:	Load Balance source
Active adapters:	Uplink1 and Uplink2
Transport VLAN:	0

- Configure a new IP Pool for ESXi overlay traffic with

Configuration detail:

Name:	TEP-Pool-02
IP addresses range:	192.168.130.71 - 192.168.130.74
CIDR:	192.168.130.0/24
Gateway:	192.168.130.1

- Using the new transport node profile, prepare ESXi cluster RegionA01-COMP01 for NSX Overlay and VLAN use.

Complete the requested task.

NOTE: Passwords are contained in the user_readme.txt. Configuration details may not be provided in the correct sequential order. Steps to complete this task must be completed in the proper order. Other tasks are dependent on the completion Of this task. You may want to move to other tasks/steps while waiting for configuration changes to be applied. This task should take approximately 20 minutes to complete.

Answer:

Explanation:

See the Explanation part of the Complete Solution and step by step instructions.

Explanation

To prepare a VMware NSX-T Data Center ESXi compute cluster infrastructure, you need to follow these steps:

Log in to the NSX Manager UI with admin credentials. The default URL is

<https://<nsx-manager-ip-address>>.

Navigate to System > Fabric > Profiles > Transport Node Profiles and click Add Profile.

Enter a name and an optional description for the transport node profile.

In the Host Switches section, click Set and select N-VDS as the host switch type.

Enter a name for the N-VDS switch and select the mode as Standard or Enhanced Datapath, depending on your requirements.

Select the transport zones that you want to associate with the N-VDS switch. You can select one overlay transport zone and one or more VLAN transport zones.

Select an uplink profile from the drop-down menu or create a custom one by clicking New Uplink Profile.

In the IP Assignment section, select Use IP Pool and choose an existing IP pool from the drop-down menu or create a new one by

clicking New IP Pool.

In the Physical NICs section, map the uplinks to the physical NICs on the host. For example, map Uplink 1 to vmnic2 and Uplink 2 to vmnic3.

Click Apply and then click Save to create the transport node profile.

Navigate to System > Fabric > Nodes > Host Transport Nodes and click Add Host Transport Node.

Select vCenter Server as the compute manager and select the cluster that contains the two ESXi servers that you want to prepare for NSX-T overlay and VLAN use.

Select the transport node profile that you created in the previous steps and click Next.

Review the configuration summary and click Finish to start the preparation process.

The preparation process may take some time to complete. You can monitor the progress and status of the host transport nodes on the Host Transport Nodes page. Once the preparation is complete, you will see two host transport nodes with a green status icon and a Connected state. You have successfully prepared a VMware NSX-T Data Center ESXi compute cluster infrastructure using a transport node profile.

NEW QUESTION # 17

SIMULATION

Task 16

You are working to automate your NSX-T deployment and an automation engineer would like to retrieve your BOP routing information from the API.

You need to:

- * Run the GET call in the API using Postman
- * Save output to the desktop to a text file called API.txt

Complete the requested task.

Notes: Passwords are contained in the user _ readme.txt. This task is not dependent on another. This task should take approximately 5 minutes to complete.

Answer:

Explanation:

See the Explanation part of the Complete Solution and step by step instructions Explanation:

To run the GET call in the API using Postman and save the output to the desktop to a text file called API.txt, you need to follow these steps:

Open Postman and create a new request tab. Select GET as the method from the drop-down menu.

Enter the URL of the NSX-T Policy API endpoint for retrieving the BGP routing table, such as https://<nsx-manager-ip-address>/policy/api/v1/infra/tier-0s/vmc/routing-table?enforcement_point_path=/infra/sites/default/enforcement-points/vmc-enforcementpoint Click the Authorization tab and select Basic Auth as the type from the drop-down menu. Enter your NSX-T username and password in the Username and Password fields, such as admin and VMware1!.

Click Send to execute the request and view the response in the Body tab. You should see a JSON object with the BGP routing table information, such as routes, next hops, prefixes, etc.

Click Save Response and select Save to a file from the drop-down menu. Enter API.txt as the file name and choose Desktop as the location. Click Save to save the output to your desktop.

You have successfully run the GET call in the API using Postman and saved the output to your desktop to a text file called API.txt.

NEW QUESTION # 18

SIMULATION

Task 15

You have been asked to enable logging so that the global operations team can view in Realize Log Insight that their Service Level Agreements are being met for all network traffic that is going in and out of the NSX environment. This NSX environment is an Active / Active two Data Center design utilizing N-VDS with BCP. You need to ensure successful logging for the production NSX-T environment.

You need to:

Verify via putty with SSH that the administrator can connect to all NSX-Transport Nodes. You will use the credentials identified in Putty (admin).

Verify that there is no current active logging enabled by reviewing that directory is empty `~/var/log/syslog`- Enable NSX Manager Cluster logging Select multiple configuration choices that could be appropriate success criteria Enable NSX Edge Node logging

Validate logs are generated on each selected appliance by reviewing the `~/var/log/syslog` Complete the requested task.

Notes: Passwords are contained in the user _ readme.txt. complete.

These task steps are dependent on one another. This task should take approximately 10 minutes to complete.

Answer:

Explanation:

See the Explanation part of the Complete Solution and step by step instructions Explanation:

To enable logging for the production NSX-T environment, you need to follow these steps:

Verify via putty with SSH that the administrator can connect to all NSX-Transport Nodes. You can use the credentials identified in Putty (admin) to log in to each transport node. For example, you can use the following command to connect to the sfo01w01en01 edge transport node: `ssh admin@sfo01w01en01`. You should see a welcome message and a prompt to enter commands.

Verify that there is no current active logging enabled by reviewing that directory is empty `~/var/log/syslog`. You can use the `ls` command to list the files in the `~/var/log/syslog` directory. For example, you can use the following command to check the sfo01w01en01 edge transport node: `ls /var/log/syslog`. You should see an empty output if there is no active logging enabled.

Enable NSX Manager Cluster logging. You can use the `search_web("NSX Manager Cluster logging configuration")` tool to find some information on how to configure remote logging for NSX Manager Cluster. One of the results is NSX-T Syslog Configuration Revisited - vDives, which provides the following steps:

Navigate to System > Fabric > Profiles > Node Profiles then select All NSX Nodes then under Syslog Servers click +ADD Enter the IP or FQDN of the syslog server, the Port and Protocol and the desired Log Level then click ADD Select multiple configuration choices that could be appropriate success criteria. You can use the `search_web("NSX-T logging success criteria")` tool to find some information on how to verify and troubleshoot logging for NSX-T. Some of the possible success criteria are:

The syslog server receives log messages from all NSX nodes

The log messages contain relevant information such as timestamp, hostname, facility, severity, message ID, and message content The log messages are formatted and filtered according to the configured settings The log messages are encrypted and authenticated if using secure protocols such as TLS or LI-TLS Enable NSX Edge Node logging. You can use the `search_web("NSX Edge Node logging configuration")` tool to find some information on how to configure remote logging for NSX Edge Node. One of the results is Configure Remote Logging - VMware Docs, which provides the following steps:

Run the following command to configure a log server and the types of messages to send to the log server. Multiple facilities or message IDs can be specified as a comma delimited list, without spaces.

`set logging-server <hostname-or-ip-address [port]> proto <proto> level <level> [facility <facility>] [messageid <messageid>] [serverca <filename>] [clientca <filename>] [certificate <filename>] [key <filename>] [structured-data <structured-data>]` Validate logs are generated on each selected appliance by reviewing the `~/var/log/syslog`. You can use the `cat` or `tail` commands to view the contents of the `~/var/log/syslog` file on each appliance. For example, you can use the following command to view the last 10 lines of the sfo01w01en01 edge transport node: `tail -n 10 /var/log/syslog`. You should see log messages similar to this:

2023-04-06T12:34:56+00:00 sfo01w01en01 user.info nsx-edge[1234]: 2023-04-06T12:34:56Z nsx-edge[1234]: INFO: [nsx@6876 comp="nsx-edge" subcomp="nsx-edge" level="INFO" security="False"] Message from nsx-edge You have successfully enabled logging for the production NSX-T environment.

NEW QUESTION # 19

Task 11

upon testing the newly configured distributed firewall policy for the Boston application. it has been discovered that the Boston-Web virtual machines can be "pinged" via ICMP from the main console. Corporate policy does not allow pings to the Boston VMs.

You need to:

- * Troubleshoot ICMP traffic and make any necessary changes to the Boston application security policy.

Complete the requested task.

Notes: Passwords are contained in the user_readme.txt. This task is dependent on Task 5.

Answer:

Explanation:

See the Explanation part of the Complete Solution and step by step instructions.

Explanation

To troubleshoot ICMP traffic and make any necessary changes to the Boston application security policy, you need to follow these steps:

Log in to the NSX Manager UI with admin credentials. The default URL is

`https://<nsx-manager-ip-address>`.

Navigate to Security > Distributed Firewall and select the firewall policy that applies to the Boston application. For example, select Boston-web-Application.

Click Show IPsec Statistics and view the details of the firewall rule hits and logs. You can see which rules are matching the ICMP traffic and which actions are taken by the firewall.

If you find that the ICMP traffic is allowed by a rule that is not intended for it, you can edit the rule and change the action to Drop or Reject. You can also modify the source, destination, or service criteria of the rule to make it more specific or exclude the ICMP traffic.

If you find that the ICMP traffic is not matched by any rule, you can create a new rule and specify the action as Drop or Reject. You can also specify the source, destination, or service criteria of the rule to match only the ICMP traffic from the main console to the Boston web VMs.

After making the changes, click Publish to apply the firewall policy.

Verify that the ICMP traffic is blocked by pinging the Boston web VMs from the main console again. You should see a message saying "Request timed out" or "Destination unreachable".

NEW QUESTION # 20

.....

Do you feel aimless and helpless when the 3V0-41.22 exam is coming soon? If your answer is absolutely yes, then we would like to suggest you to try our 3V0-41.22 training materials, which are high quality and efficiency test tools. Your success is 100% ensured to pass the 3V0-41.22 Exam and acquire the dreaming certification which will enable you to reach for more opportunities to higher incomes or better enterprises.
