Exam AAISM Online - AAISM Exam Engine

The ISACA Advanced in AI Security Management (AAISM) Exam (AAISM) certification test is an important part of career growth, and passing it may lead to more employment opportunities. However, preparing for the ISACA Advanced in AI Security Management (AAISM) Exam (AAISM) test may be tough, and many busy applicants have difficulty cracking it. This is where PracticeDump ISACA Advanced in AI Security Management (AAISM) Exam real exam questions come to help you clear the test in a short time.

For example, if you are a college student, you can learn and use online resources through the student learning platform over the AAISM study materials. On the other hand, the AAISM study engine are for an office worker, free profession personnel have different learning arrangement, such extensive audience greatly improved the core competitiveness of our AAISM Exam Questions, to provide users with better suited to their specific circumstances of high quality learning resources, according to their aptitude, on-demand, maximum play to the role of the AAISM exam questions.

2025 Exam AAISM Online | Trustable ISACA Advanced in AI Security Management (AAISM) Exam 100% Free Exam Engine

Just the same as the free demos of our AAISM learning quiz, we have provided three kinds of versions of our AAISM preparation exam, among which the PDF version is the most popular one. It is understandable that many people give their priority to use paper-based materials rather than learning on computers, and it is quite clear that the PDF version is convenient for our customers to read and print the contents in our AAISM Study Guide.

ISACA Advanced in AI Security Management (AAISM) Exam Sample Questions (Q36-Q41):

NEW QUESTION # 36
Which of the following should be a PRIMARY consideration when defining recovery point objectives (RPOs) and recovery time objectives (RTOs) for generative AI solutions?

- A. Ensuring the backup system can restore training data sets within the defined RTO window

- B. Prioritizing computational efficiency over data integrity to minimize downtime
- C. Maintaining consistent hardware configurations to prevent discrepancies during model restoration
- D. Preserving the most recent versions of data models to avoid inaccuracies in functionality

Answer: A

Explanation:
When setting RPOs and RTOs for AI systems, especiallygenerative AI, thecritical factor is the restoration of training data and model artifacts within the recovery window. Without this, restored systems may function inaccurately or incompletely, undermining business continuity.
AAISM risk management principles emphasize:
* Recovery objectives must align withdata protection requirementsfor both training and inference data.
* The ability to restorelarge-scale training datasetsis primary, since downtime without them leads to operational and compliance risks.
* Computational efficiency and hardware consistency are secondary considerations, but not the primary drivers of RPO/RTO definitions.
Thus, ensuring backup and restore capabilities of training datasets directly within RTO is theprimary requirement.

NEW QUESTION # 37
Which of the following is the GREATEST risk inherent to implementing generative AI?

- A. Inadequate return on investment (ROI)
- B. Potential intellectual property violations
- C. Lack of employee training
- D. Unidentified asset vulnerabilities

Answer: B

Explanation:
The AAISM framework identifies intellectual property (IP) violations as the most significant inherent risk in deploying generative AI. These systems often rely on large-scale internet data for training, which may inadvertently contain copyrighted or proprietary material. This creates legal and reputational exposure when outputs reproduce or reference protected content. While employee training gaps, asset vulnerabilities, and ROI concerns are relevant risks, they are not inherent to generative models themselves. The greatest inherent risk tied directly to generative AI adoption is the possibility of violating intellectual property rights.

NEW QUESTION # 38
Which of the following types of testing can MOST effectively mitigate prompt hacking?

- A. Adversarial
- B. Regression
- C. Input
- D. Load

Answer: A

Explanation:
Prompt hacking manipulates large language models by injecting adversarial instructions into inputs to bypass or override safeguards. The AAISM framework identifies adversarial testing as the most effective way to simulate such manipulative attempts, expose vulnerabilities, and improve the resilience of controls. Load testing evaluates performance, input testing checks format validation, and regression testing validates functionality after changes. None of these directly address the manipulation of natural language inputs. Adversarial testing is therefore the correct approach to mitigate prompt hacking risks.

NEW QUESTION # 39

Which of the following is the MOST important consideration when deciding how to compose an AI red team?

- A. AI use cases
- B. Time-to-market constraints
- C. Resource availability
- D. Compliance requirements

Answer: A

Explanation:

AAISM materials specify that the composition of an AI red team must be tailored to the organization's AI use cases. The purpose of red-teaming is to simulate realistic adversarial conditions aligned with the actual applications of AI. For example, testing a generative model requires different expertise than testing a fraud detection system. While resource availability, compliance requirements, and time-to-market pressures are practical considerations, they are secondary to aligning team expertise with use case scenarios. The most important factor is therefore the AI use cases themselves.

NEW QUESTION # 40

Which of the following is the MOST important course of action prior to placing an in-house developed AI solution into production?

- A. Deploy a prototype of the solution
- B. Obtain senior management sign-off
- C. Perform a privacy, security, and compliance gap analysis
- D. Perform testing, evaluation, validation, and verification

Answer: D

Explanation:

AAISM lifecycle governance guidance specifies that before any AI solution is moved into production, it must undergo testing, evaluation, validation, and verification to ensure accuracy, resilience, security, and compliance with standards. These steps confirm that the solution performs as expected under varied conditions. Conducting gap analysis is part of compliance checks but comes earlier in design. Management sign-off provides approval but cannot substitute for assurance of technical reliability. Deploying prototypes is a testing method but not the final assurance step. The critical requirement is a complete cycle of testing, validation, and verification.
