Amazon DVA-C02 Certification Exam is designed for individuals who want to validate their skills in developing and deploying applications on the Amazon Web Services (AWS) platform. AWS Certified Developer - Associate certification is specifically for developers who have experience working with AWS services and want to showcase their expertise in designing, deploying, and maintaining AWS-based applications.

Amazon AWS Certified Developer - Associate Sample Questions (Q323-Q328):

NEW QUESTION # 323

A development team wants to build a continuous integration/continuous delivery (CI/CD) pipeline. The team is using AWS CodePipeline to automate the code build and deployment. The team wants to store the program code to prepare for the CI/CD pipeline.

Which AWS service should the team use to store the program code?

- A. AWS CodeDeploy

- B. AWS CodeArtifact
- C. Amazon CodeGuru
- **D. AWS CodeCommit**

Answer: D

NEW QUESTION # 324

A developer is testing a RESTful application that is deployed by using Amazon API Gateway and AWS Lambda. When the developer tests the user login by using credentials that are not valid, the developer receives an HTTP 405 METHOD_NOT_ALLOWED error. The developer has verified that the test is sending the correct request for the resource. Which HTTP error should the application return in response to the request?

- A. HTTP 505
- **B. HTTP 401**
- C. HTTP 404
- D. HTTP 503

Answer: B

Explanation:

Explanation

The HTTP 401 error indicates that the request has not been applied because it lacks valid authentication credentials for the target resource. This is the appropriate error code to return when the user login fails due to invalid credentials. The HTTP 405 error means that the method specified in the request is not allowed for the resource identified by the request URI, which is not the case here. The other error codes are not relevant to the authentication failure scenario. References

NEW QUESTION # 325

An application is using Amazon Cognito user pools and identity pools for secure access. A developer wants to integrate the user-specific file upload and download features in the application with Amazon S3. The developer must ensure that the files are saved and retrieved in a secure manner and that users can access only their own files. The file sizes range from 3 KB to 300 MB. Which option will meet these requirements with the HIGHEST level of security?

- **A. Use an IAM policy within the Amazon Cognito identity prefix to restrict users to use their own folders in Amazon S3.**
- B. Save the details of the uploaded files in a separate Amazon DynamoDB table. Filter the list of files in the user interface (UI) by comparing the current user ID with the user ID associated with the file in the table.
- C. Use S3 Event Notifications to validate the file upload and download requests and update the user interface (UI).
- D. Use Amazon API Gateway and an AWS Lambda function to upload and download files. Validate each request in the Lambda function before performing the requested operation.

Answer: A

Explanation:

This solution ensures that users can access only their own files in a secure manner.

NEW QUESTION # 326

A company is creating a new application that gives users the ability to upload and share short video files. The average size of the video files is 10 MB. After a user uploads a file, a message needs to be placed into an Amazon Simple Queue Service (Amazon SQS) queue so the file can be processed. The files need to be accessible for processing within 5 minutes. Which solution will meet these requirements MOST cost-effectively?

- **A. Write the files to Amazon S3 Standard. Add the S3 location of the files to the SQS queue.**
- B. Write the files to an Amazon Elastic Block Store (Amazon EBS) General Purpose SSD volume. Add the EBS location of the files to the SQS queue.
- C. Write the files to Amazon S3 Glacier Deep Archive. Add the S3 location of the files to the SQS queue.
- D. Write messages that contain the contents of the uploaded files to the SQS queue.

Answer: A

Explanation:

Comprehensive Detailed Explanation with all AWS Reference

Why Option B is Correct:

Amazon S3 Standard provides immediate access to files and is cost-effective for files that need to be accessed within 5 minutes.

By adding the S3 location to the SQS queue, you avoid transferring large files directly, which is both more efficient and scalable.

Why Other Options are Incorrect:

Option A: S3 Glacier Deep Archive is designed for archival storage with retrieval times ranging from minutes to hours, which does not meet the 5-minute requirement.

Option C: Amazon EBS is designed for block storage attached to EC2 instances, which adds unnecessary complexity and cost.

Option D: SQS is not designed to handle large file content directly and has message size limits (256 KB).

NEW QUESTION # 327

A developer is receiving an intermittent `ProvisionedThroughputExceededException` error from an application that is based on Amazon DynamoDB. According to the Amazon CloudWatch metrics for the table, the application is not exceeding the provisioned throughput. What could be the cause of the issue?

- A. The DynamoDB table storage size is larger than the provisioned size.
- B. The application is exceeding capacity on a particular sort key.
- C. The DynamoDB table is exceeding the provisioned scaling operations.
- **D. The application is exceeding capacity on a particular hash key.**

Answer: D

Explanation:

DynamoDB distributes throughput across partitions based on the hash key. A hot partition (caused by high usage of a specific hash key) can result in a `ProvisionedThroughputExceededException`, even if overall usage is below the provisioned capacity.

* Why Option B is Correct:

* Partition-Level Limits: Each partition has a limit of 3,000 read capacity units or 1,000 write capacity units per second.

* Hot Partition: Excessive use of a single hash key can overwhelm its partition.

* Why Not Other Options:

* Option A: DynamoDB storage size does not affect throughput.

* Option C: Provisioned scaling operations are unrelated to throughput errors.

* Option D: Sort keys do not impact partition-level throughput.
