Amazon AWS Certified Developer Associate Exam (DVA-C02) Sample Questions (Q339-Q344):

NEW QUESTION # 339

An Amazon RDS database instance is used by many applications to look up historical data. The query rate is relatively constant. When the historical data is updated each day, the resulting write traffic slows the read query performance and affects all application users.

What can be done to eliminate the performance impact on application users?

- A. Implement Amazon ElastiCache in front of Amazon RDS to buffer the write traffic.
- B. Make sure Amazon RDS is Multi-AZ so it can better absorb increased traffic.
- C. Create an RDS Read Replica and direct all read traffic to the replica.
- D. Use Amazon DynamoDB instead of Amazon RDS to buffer the read traffic.

Answer: C

NEW QUESTION # 340

Can a user associate and use his own DNS with ELB instead of the DNS provided by AWS ELB?

- A. Yes, only through Route 53 by mapping ELB and DNS
- B. No
- C. Yes, by creating a CNAME with the existing domain name provider
- D. Yes, by configuring DNS in the AWS Console

Answer: C

Explanation:
The AWS ELB allows mapping a custom domain name with ELB. The user can map ELB with DNS in two ways: 1) By creating CNAME with the existing domain name service provider or 2) By creating a record with Route 53.

NEW QUESTION # 341

A stock market monitoring application uses Amazon Kinesis for data ingestion. During simulated tests of peak data rates, the Kinesis stream cannot keep up with the incoming data.

What step will allow Kinesis to accommodate the traffic during peak hours?

- A. Install the Kinesis Producer Library (KPL) for ingesting data into the stream.
- B. Reduce the data retention period to allow for more data ingestion using . DecreaseStreamRetentionPeriod
- C. Ingest multiple records into the stream in a single call using PutRecords.
- D. Increase the shard count of the stream using UpdateShardCount.

Answer: A

NEW QUESTION # 342

A user has developed an application which is required to send the data to a NoSQL database. The user wants to decouple the data sending such that the application keeps processing and sending data but does not wait for an acknowledgement of DB. Which of the below mentioned applications helps in this scenario?

- A. AWS Simple Workflow
- B. AWS Simple Query Service
- C. AWS Simple Queue Service
- D. AWS Simple Notification Service

Answer: C

Explanation:
Amazon Simple Queue Service (SQS) is a fast, reliable, scalable, and fully managed message queuing service. SQS provides a simple and cost-effective way to decouple the components of an application. In this case, the user can use AWS SQS to send messages which are received from an application and sent to DB. The application can continue processing data without waiting for any acknowledgement from DB.
The user can use SQS to transmit any volume of data without losing messages or requiring other services to always be available.

NEW QUESTION # 343
An application contains two components: one component to handle HTTP requests, and another component to handle background processing tasks. Each component must scale independently.
The developer wants to deploy this application using AWS Elastic Beanstalk.
How should this application be deployed, based on these requirements?

- A. Deploy the application in a single Elastic Beanstalk environment.
- B. Use multiple Elastic Beanstalk environments for the background task component, but one environment for the HTTP component.
- C. Use multiple Elastic Beanstalk environments for the HTTP component, but one environment for the background task component.
- D. Deploy each component in a separate Elastic Beanstalk environment.

Answer: B
