

Exam AWS-Solutions-Associate Simulations, AWS-Solutions-Associate Valid Test Papers

Amazon (AWS)		Certification Details
AWS Solutions Architect Associate (SAA-C03)		
 Prior Certification Not Required	 Exam Validity 3 Years	 Exam Fee \$150 USD
 Exam Duration 130 minutes	 No. of Questions 60-70	 Passing Marks 70-75%
 Recommended Experience At least 1 year of hands-on experience designing secure, high-performing, cost-effective, and scalable systems on AWS.		 Exam Format Multiple Choice & Multiple Select
 Languages English, French, German, Italian, Japanese, Korean, Portuguese, Simplified Chinese, and Spanish

No matter you are exam candidates of high caliber or newbies, our Amazon AWS-Solutions-Associate exam quiz will be your propulsion to gain the best results with least time and reasonable money. Not only because the outstanding content of AWS-Solutions-Associate Real Dumps that produced by our professional expert but also for the reason that we have excellent vocational moral to improve our AWS-Solutions-Associate learning materials quality.

To prepare for the AWS Certified Solutions Architect - Associate (SAA-C02) exam, candidates can take advantage of the many resources provided by AWS, including online courses, practice exams, and whitepapers. Additionally, there are many third-party training providers that offer classroom and online courses, as well as study guides and practice exams.

AWS-Solutions-Associate Valid Test Papers | New AWS-Solutions-Associate Test Book

Our AWS-Solutions-Associate exam question will be constantly updated every day. The IT experts of our company will be responsible for checking whether our AWS-Solutions-Associate exam prep is updated or not. Once our AWS-Solutions-Associate test questions are updated, our system will send the message to our customers immediately. If you use our AWS-Solutions-Associate exam prep, you will have the opportunity to enjoy our updating system. You will get the newest information about your exam in the shortest time. It not only can help you protect your eyes, but also it will be very convenient for you to make notes. We believe that you will like our AWS-Solutions-Associate Exam Prep.

Amazon AWS Certified Solutions Architect - Associate (SAA-C02) Sample Questions (Q82-Q87):

NEW QUESTION # 82

A user has launched one EC2 instance in the US West region. The user wants to access the RDS instance launched in the US East region from that EC2 instance. How can the user configure the access for that EC2 instance?

- A. Configure the IP range of the US West region instance as the ingress security rule of RDS
- B. Create an IAM role which has access to RDS and launch an instance in the US West region with it
- C. It is not possible to access RDS of the US East region from the US West region
- D. Open the security group of the US West region in the RDS security group's ingress rule

Answer: A

Explanation:

The user cannot authorize an Amazon EC2 security group if it is in a different AWS Region than the RDS DB instance. The user can

authorize an IP range or specify an Amazon EC2 security group in the same region that refers to an IP address in another region.
Reference:
http://docs.aws.amazon.com/AmazonRDS/latest/UserGuide/USER_WorkingWithSecurityGroups.html

NEW QUESTION # 83

When you view the block device mapping for your instance, you can see only the EBS volumes, not the instance store volumes.

- A. Depends on the instance type
- B. FALSE
- C. TRUE
- D. Depends on whether you use API call

Answer: C

NEW QUESTION # 84

A solutions architect is designing the cloud architecture for a new application being deployed on AWS. The process should run in parallel while adding and removing application nodes as needed based on the number of jobs to be processed. The processor application is stateless. The solutions architect must ensure that the application is loosely coupled and the job items are durably stored.

Which design should the solutions architect use?

- A. Create an Amazon SQS queue to hold the jobs that need to be processed Create an Amazon Machine image (AMI) that consists of the processor application Create a launch template that uses the AMI Create an Auto Scaling group using the launch template Set the scaling policy for the Auto Scaling group to add and remove nodes based on the number of items in the SQS queue
- B. Create an Amazon SQS queue to hold the jobs that need to be processed Create an Amazon Machine image (AMI) that consists of the processor application Create a launch configuration that uses the AMI Create an Auto Scaling group using the launch configuration Set the scaling policy for the Auto Scaling group to add and remove nodes based on network usage
- C. Create an Amazon SNS topic to send the jobs that need to be processed Create an Amazon Machine Image (AMI) that consists of the processor application Create a launch configuration that uses the AMI Create an Auto Scaling group using the launch configuration Set the scaling policy for the Auto Scaling group to add and remove nodes based on CPU usage
- D. Create an Amazon SNS topic to send the jobs that need to be processed Create an Amazon Machine Image (AMI) that consists of the processor application Create a launch template that uses the AMI Create an Auto Scaling group using the launch template Set the scaling policy for the Auto Scaling group to add and remove nodes based on the number of messages published to the SNS topic

Answer: A

Explanation:

Explanation

"Create an Amazon SQS queue to hold the jobs that need to be processed. Create an Amazon EC2 Auto Scaling group for the compute application. Set the scaling policy for the Auto Scaling group to add and remove nodes based on the number of items in the SQS queue" In this case we need to find a durable and loosely coupled solution for storing jobs. Amazon SQS is ideal for this use case and can be configured to use dynamic scaling based on the number of jobs waiting in the queue. To configure this scaling you can use the backlog per instance metric with the target value being the acceptable backlog per instance to maintain. You can calculate these numbers as follows: Backlog per instance: To calculate your backlog per instance, start with the `ApproximateNumberOfMessages` queue attribute to determine the length of the SQS queue

NEW QUESTION # 85

A company has a three-tier image-sharing application it uses an Amazon EC2 instance for the front-end layer, another for the backend tier, and a third for the MySQL database A solutions architect has been tasked with designing a solution that is highly available, and requires the least amount of changes to the application Which solution meets these requirements?

- A. Use Amazon S3 to host the front-end layer and AWS Lambda functions for the backend layer Move the database to an Amazon DynamoDB table and use Amazon S3 to store and serve users' images
- B. Use load-balanced Multi-AZ AWS Elastic Beanstalk environments for the front-end and backend layers Move the database to an Amazon RDS instance with multiple read replicas to store and serve users' images.

- C. Use load-balanced Multi-AZ AWS Elastic Beanstalk environments for the front-end and backend layers. Move the database to an Amazon RDS instance with a Multi-AZ deployment. Use Amazon S3 to store and serve users' images.
- D. Use Amazon S3 to host the front-end layer and a fleet of Amazon EC2 instances in an Auto Scaling group for the backend layer. Move the database to a memory optimized instance type to store and serve users' images.

Answer: C

NEW QUESTION # 86

You are designing a photo sharing mobile app. The application will store all pictures in a single Amazon S3 bucket.

Users will upload pictures from their mobile device directly to Amazon S3 and will be able to view and download their own pictures directly from Amazon S3.

You want to configure security to handle potentially millions of users in the most secure manner possible. What should your server-side application do when a new user registers on the photo-sharing mobile application?

- A. Create an IAM user. Update the bucket policy with appropriate permissions for the IAM user. Generate an access key and secret key for the IAM user, store them in the mobile app, and use these credentials to access Amazon S3.
- B. Record the user's information in Amazon RDS and create a role in IAM with appropriate permissions. When the user uses their mobile app, create temporary credentials using the AWS Security Token Service 'AssumeRole' function. Store these credentials in the mobile app's memory and use them to access Amazon S3. Generate new credentials the next time the user runs the mobile app.
- C. Create IAM user. Assign appropriate permissions to the IAM user. Generate an access key and secret key for the IAM user, store them in the mobile app, and use these credentials to access Amazon S3.
- D. Create a set of long-term credentials using AWS Security Token Service with appropriate permissions. Store these credentials in the mobile app and use them to access Amazon S3.
- E. Record the user's information in Amazon DynamoDB. When the user uses their mobile app, create temporary credentials using AWS Security Token Service with appropriate permissions. Store these credentials in the mobile app's memory and use them to access Amazon S3. Generate new credentials the next time the user runs the mobile app.

Answer: B

NEW QUESTION # 87
