Online 220-1102 Test - Latest Braindumps 220-1102 Book

We have professional technicians to check website at times, therefore if you buy 220-1102 Study Materials from us, we can ensure you that you can have a clean and safe shopping environment. Moreover 220-1102 exam braindumps of us is compiled by professional experts, and therefore the quality and accuracy can be guaranteed. We have online and offline chat service stuff, if you have any questions, you can contact us, we will give you reply as quickly as possible.

CompTIA 220-1102 Exam consists of 90 multiple-choice and performance-based questions that test candidates' knowledge and skills in various areas of IT support. 220-1102 exam is designed to validate the candidate's ability to install, configure, and troubleshoot operating systems, software, and hardware, as well as implement basic security measures. Candidates are also expected to demonstrate their understanding of operational procedures, including customer service and communication skills.

CompTIA A+ Certification Exam: Core 2 Sample Questions (Q844-Q849):

NEW QUESTION # 844

A user has a computer with Windows 10 Home installed and purchased a Windows 10 Pro license. The user is not sure how to upgrade the OS. Which of the following should the technician do to apply this license?

- A. Activate with the digital license included with the device hardware.
- B. Redeem the included activation key card for a product key.
- C. Copy the c:\Windows\windows.lie file over to the machine and restart.
- D. Insert a Windows USB hardware dongle and initiate activation.

Answer: B

Explanation:

Redeeming the included activation key card for a product key is the correct way to apply a Windows 10 Pro license to a computer that has Windows 10 Home installed. The activation key card is a physical or digital card that contains a 25-digit code that can be used to activate Windows 10 Pro online or by phone. Copying the windows.lie file, inserting a Windows USB hardware dongle and activating with the digital license are not valid methods of applying a Windows 10 Pro license. Verified References:

NEW QUESTION # 845

A technician is troubleshooting a Windows 10 PC that is unable to start the GUI. A new SSD and a new copy of Windows were recently installed on the PC. Which of the following is the most appropriate command to use to fix the issue?

- A. chkdsk
- B. msconfig
- C. sfc
- D. diskpart
- E. mstsc

Answer: C

Explanation:

The sfc command is a tool for scanning and repairing system files that are corrupted or missing on Windows operating systems¹². System files are essential files that are required for the proper functioning of the operating system, such as the GUI, drivers, services, and applications. If system files are damaged or deleted, the operating system may fail to start or run properly, causing errors, crashes, or blue screens.

The sfc command can be used to fix the issue of the PC that is unable to start the GUI, assuming that the problem is caused by corrupted or missing system files. The sfc command can be run from the command prompt, which can be accessed by booting the PC from the installation media, choosing the repair option, and selecting the command prompt option³. The sfc command can be used with different switches, such as /scannow, /verifyonly, /scanfile, or /offbootdir, depending on the situation and the desired action⁴. The most common switch is /scannow, which scans all the system files and repairs any problems that are found⁵. The syntax of the sfc command with the /scannow switch is:

sfc /scannow

The sfc command will then scan and repair the system files, and display the results on the screen. If the sfc command is able to fix the system files, the PC should be able to start the GUI normally after rebooting. If the sfc command is unable to fix the system files, the PC may need further troubleshooting or a clean installation of Windows.

NEW QUESTION # 846

Which of the following is also known as something you know, something you have, and something you are?

- A. SMS
- B. ACL
- C. MFA
- D. NFC

Answer: C

Explanation:

MFA stands for Multi-Factor Authentication, which is a method of verifying a user's identity using two or more different factors of authentication. The three factors of authentication are something you know, something you have, and something you are. These factors correspond to different types of information or evidence that only the legitimate user should possess or provide. For example:

Something you know: a password, a PIN, a security question, etc.

Something you have: a smart card, a token, a mobile device, etc.

Something you are: a fingerprint, a face, an iris, etc.

MFA provides a higher level of security than single-factor authentication, which only uses one factor, such as a password. MFA reduces the risk of unauthorized access, identity theft, and data breaches, as an attacker would need to compromise more than one factor to impersonate a user. MFA is commonly used for online banking, email accounts, cloud services, and other sensitive

applications

NEW QUESTION # 847

A user requested that the file permissions on a Linux device be changed to only allow access to a certain group of users. Which of the following commands should be used to complete the user's request?

- A. cat
- B. cacs
- C. **chmod**
- D. pwd

Answer: C

Explanation:

The chmod command is used to change the permissions of files and directories in Linux. It can grant or revoke read, write, and execute permissions for the owner, the group, and others. To change the file permissions to only allow access to a certain group of users, the chmod command can use either the symbolic or the numeric mode. For example, to give read and write permissions to the group and no permissions to others, the command can be:

chmod g+rw,o-rwx filename

or

chmod 660 filename

NEW QUESTION # 848

A user's corporate laptop with proprietary work Information was stolen from a coffee shop. The user toggled in to the laptop with a simple password. and no other security mechanisms were in place. Which of the following would MOST likely prevent the stored data from being recovered?

- A. Two-factor authentication
- B. Biometrics
- C. **Full disk encryption**
- D. Enforced strong system password

Answer: C

Explanation:

Explanation

Full disk encryption is a security mechanism that encrypts the entire data on a hard drive, making it unreadable without the correct decryption key or password. It can prevent the stored data from being recovered by unauthorized persons who steal or access the laptop. Biometrics, enforced strong system password and two-factor authentication are other security mechanisms, but they only protect the login access to the laptop, not the data on the hard drive.
