Data-Cloud-Consultant Test Dumps Pdf - New Data-Cloud-Consultant Test Vce Free

Our Data-Cloud-Consultant study materials are compiled specially for time-sensitive exam candidates if you are wondering. Eliminating all invaluable questions, we offer Data-Cloud-Consultant practice guide with real-environment questions and detailed questions with unreliable prices upon them and guarantee you can master them effectively. As you see on our website, our price of the Data-Cloud-Consultant Exam Question is really reasonable and favourable.

Salesforce Certified Data Cloud Consultant Sample Questions (Q41-Q46):

NEW QUESTION # 41

How does Data Cloud handle an individual's Right to be Forgotten?

- **A. Deletes the specified Individual and records from any data model object/data lake object related to the Individual.**
- B. Deletes the records from all data source objects, and any downstream data model objects are updated at the next scheduled ingestion
- C. Deletes the specified Individual record and its Unified Individual Link record.
- D. Deletes the specified Individual and records from any data source object mapped to the Individual data model object.

Answer: A

Explanation:

Data Cloud handles an individual's Right to be Forgotten by deleting the specified Individual and records from any data model object/data lake object related to the Individual. This means that Data Cloud removes all the data associated with the individual from the data space, including the data from the source objects, the unified individual profile, and any related objects. Data Cloud also deletes the Unified Individual Link record that links the individual to the source records. Data Cloud uses the Consent API to process the Right to be Forgotten requests, which are reprocessed at 30, 60, and 90 days to ensure a full deletion.

The other options are not correct descriptions of how Data Cloud handles an individual's Right to be Forgotten. Data Cloud does not delete the records from all data source objects, as this would affect the data integrity and availability of the source systems. Data Cloud also does not delete only the specified Individual record and its Unified Individual Link record, as this would leave the source records and the related records intact. Data Cloud also does not delete only the specified Individual and records from any data source object mapped to the Individual data model object, as this would leave the related records intact.

NEW QUESTION # 42

Cumulus Financial offers both business and personal loans. Records in the Contact DLO can be useful for both groups since individual customers may have both business and personal loans. However, for legal reasons, the two groups must be kept separate. How should Cumulus Financial solve this business requirement?

- A. Duplicate the Individual DM0.
- **B. Use two data spaces.**
- C. Duplicate the Contact DLO.
- D. Create two identity resolution rules in the same data space.

Answer: B

Explanation:

To address the business requirement where Cumulus Financial needs to keep business and personal loan records separate for legal reasons while still leveraging the same Contact DLO, the best solution is to use two data spaces. Here's why and how this works:

Understanding Data Spaces in Salesforce Data Cloud :

Data spaces are logical containers within Salesforce Data Cloud that allow organizations to segment their data based on specific business needs, compliance requirements, or privacy regulations. They enable isolation of data processing and identity resolution rules while still allowing access to shared data objects like the Contact DLO.

Why Two Data Spaces?

By creating two data spaces (e.g., one for business loans and another for personal loans), Cumulus Financial can maintain separation between the two groups for legal compliance.

Both data spaces can reference the same Contact DLO, ensuring that individual customer data is not duplicated but is accessible in both contexts.

Identity resolution rules can be configured independently within each data space to ensure that the segmentation aligns with the legal

requirements.

Steps to Implement This Solution :

Step 1: Navigate to the Data Spaces section in Salesforce Data Cloud.

Step 2: Create two new data spaces: one for "Business Loans" and another for "Personal Loans." Step 3: Configure the identity resolution rules separately for each data space to ensure proper segmentation.

Step 4: Link the existing Contact DLO to both data spaces. This ensures that the same contact data is available in both contexts without duplication.

Step 5: Set up activation rules and permissions to ensure that data from one data space cannot inadvertently mix with the other.

Why Not Other Options?

A . Duplicate the Individual DMO: This would lead to unnecessary duplication of data and increase storage costs. It also introduces complexity in maintaining consistency across duplicated records.

B . Duplicate the Contact DLO: Similar to duplicating the DMO, this approach increases storage and maintenance overhead without solving the core issue of legal separation.

C . Create two identity resolution rules in the same data space: While this might seem like a viable option, it does not provide the required legal separation since both groups would still exist within the same data space.

By using two data spaces, Cumulus Financial achieves the necessary legal separation while maintaining efficiency and avoiding data redundancy.

NEW QUESTION # 43

Cumulus Financial wants to be able to track the daily transaction volume of each of its customers in real time and send out a notification as soon as it detects volume outside a customer's normal range.

What should a consultant do to accommodate this request?

- A. Use a calculated insight paired with a flow.
- B. Use streaming data transform combined with a data action.
- C. Use streaming data transform with a flow.
- **D. Use a streaming insight paired with a data action**

Answer: D

Explanation:

A streaming insight is a type of insight that analyzes streaming data in real time and triggers actions based on predefined conditions. A data action is a type of action that executes a flow, a data action target, or a data action script when an insight is triggered. By using a streaming insight paired with a data action, a consultant can accommodate Cumulus Financial's request to track the daily transaction volume of each customer and send out a notification when the volume is outside the normal range. A calculated insight is a type of insight that performs calculations on data in a data space and stores the results in a data extension. A streaming data transform is a type of data transform that applies transformations to streaming data in real time and stores the results in a data extension. A flow is a type of automation that executes a series of actions when triggered by an event, a schedule, or another flow. None of these options can achieve the same functionality as a streaming insight paired with a data action. NEW QUESTION # 44

Northern Trail Outfitters uploads new customer data to an Amazon S3 Bucket on a daily basis to be ingested in Data Cloud. Based on this, a calculated insight is created that shows the total spend per customer in the last 30 days.

In which sequence should each process be run to ensure that freshly imported data is ready and available to use for any segment?

- **A. Refresh Data Stream > Identity Resolution > Calculated Insight**
- B. Identity Resolution > Refresh Data Stream > Calculated Insight
- C. Refresh Data Stream > Calculated Insight > Identity Resolution
- D. Calculated Insight > Refresh Data Stream > Identity Resolution

Answer: A

Explanation:

To ensure that freshly imported data is ready and available for use in any segment, the processes should be run in the following sequence: Refresh Data Stream > Identity Resolution > Calculated Insight . Here's why:

Understanding the Requirement

Northern Trail Outfitters uploads new customer data daily to an Amazon S3 bucket, which is ingested into Data Cloud.

A calculated insight is created to show the total spend per customer in the last 30 days.

The goal is to ensure that the data is properly refreshed, resolved, and processed before being used in segments.

Why This Sequence?

Step 1: Refresh Data Stream

Before any processing can occur, the data stream must be refreshed to ingest the latest data from the Amazon S3 bucket.

This ensures that the most up-to-date customer data is available in Data Cloud.

Step 2: Identity Resolution

After refreshing the data stream, identity resolution must be performed to merge related records into unified profiles.

This step ensures that customer data is consolidated and ready for analysis.

Step 3: Calculated Insight

Once identity resolution is complete, the calculated insight can be generated to calculate the total spend per customer in the last 30 days.

This ensures that the insight is based on the latest and most accurate data.

Other Options Are Incorrect :

B). Refresh Data Stream > Calculated Insight > Identity Resolution : Calculated insights cannot be generated before identity resolution because they rely on unified profiles.

C). Calculated Insight > Refresh Data Stream > Identity Resolution : Calculated insights require both fresh data and resolved identities, so this sequence is invalid.

D). Identity Resolution > Refresh Data Stream > Calculated Insight : Identity resolution cannot occur without first refreshing the data stream to bring in the latest data.

Conclusion

The correct sequence is Refresh Data Stream > Identity Resolution > Calculated Insight , ensuring that the data is properly refreshed, resolved, and processed before being used in segments.

NEW QUESTION # 45

Which two common use cases can be addressed with Data Cloud?

Choose 2 answers

- A. Govern enterprise data lifecycle through a centralized set of policies and processes.
- B. Safeguard critical business data by serving as a centralized system for backup and disaster recovery.
- C. Harmonize data from multiple sources with a standardized and extendable data model.
- D. Understand and act upon customer data to drive more relevant experiences.

Answer: C,D

Explanation:

recovery.

Explanation:

Data Cloud is a data platform that can help customers connect, prepare, harmonize, unify, query, analyze, and act on their data across various Salesforce and external sources. Some of the common use cases that can be addressed with Data Cloud are:

Understand and act upon customer data to drive more relevant experiences. Data Cloud can help customers gain a 360-degree view of their customers by unifying data from different sources and resolving identities across channels. Data Cloud can also help customers segment their audiences, create personalized experiences, and activate data in any channel using insights and AI.

Harmonize data from multiple sources with a standardized and extendable data model. Data Cloud can help customers transform and cleanse their data before using it, and map it to a common data model that can be extended and customized. Data Cloud can also help customers create calculated insights and related attributes to enrich their data and optimize identity resolution.

The other two options are not common use cases for Data Cloud. Data Cloud does not provide data governance or backup and disaster recovery features, as these are typically handled by other Salesforce or external solutions.
