EMC Dell Information Storage and Management Foundations v2 Exam Sample Questions (Q59-Q64):

NEW QUESTION # 59

Question:

A company is experiencing slow write performance on its RAID 6 array. What is the most likely cause of this performance bottleneck?

- A. Insufficient storage on the RAID controller
- B. Increased network latency between the server and the storage array
- C. High read I/O load on the array

- **D. Write penalty associated with dual parity calculations**

Answer: D

Explanation:

RAID 6 uses dual parity to provide fault tolerance, which requires additional calculations during write operations. This introduces a write penalty, as the system must compute and write two sets of parity data for each write operation, leading to slower write performance compared to other RAID levels.

- * Insufficient storage on the RAID controller: Would affect storage capacity, not write performance.
- * High read I/O load on the array: Impacts read performance, not write performance.
- * Increased network latency: Affects data transfer times but not the internal write operations of the RAID array.
- * Write penalty associated with dual parity calculations: The most likely cause of slow write performance in RAID 6.

NEW QUESTION # 60

Question:

When troubleshooting a virtual machine, which file is most likely to provide a detailed history of the VM's behavior?

- A. Virtual disk file
- B. Configuration file
- **C. Log file**
- D. Memory state file

Answer: C

Explanation:

Log files record events and messages related to the operations of a virtual machine. They provide detailed information about the VM's behavior, errors, and system messages, which are crucial for troubleshooting.

NEW QUESTION # 61

Question:

Which information is contained in a stub file?

- **A. Address of the archived file**
- B. Name and size of the archived file
- C. Hard drive address storing the archived file
- D. Address of the source file

Answer: A

Explanation:

A stub file is a small placeholder file that remains on primary storage after data has been archived or moved to secondary storage. It contains a pointer or address of the archived data's location.

When accessed, the data is transparently retrieved from the archive.

- * Address of the source file and other options do not accurately describe a stub file's purpose.

NEW QUESTION # 62

Question:

What is the most common technique used by malware protection software to detect malware?

- A. Behavioral analysis
- B. Reputation-based analysis
- **C. Signature-based detection**
- D. Heuristic analysis

Answer: C

Explanation:

Signature-based detection is the most common method of malware detection. It works by comparing files and data to a database of known malware signatures:

Fast and efficient for known threats.

Updated regularly by security vendors.

* Reputation-based: Looks at the trustworthiness of files/domains.

* Behavioral: Monitors actions and identifies suspicious patterns.

* Heuristic: Detects new malware based on file behaviors and patterns, useful for unknown threats.

NEW QUESTION # 63

Question:

What is a key challenge in managing the variety aspects of Big Data?

- A. Generating real-time data
- B. Storing transaction-based data over the years
- C. Reducing data volume to manageable sizes
- **D. Combining data from various sources and formats cost-effectively**

Answer: D

Explanation:

Big Data's "variety" refers to the challenge of integrating different data types (structured, semi-structured, unstructured) from various sources.

The key challenge is to combine and manage this data cost-effectively, ensuring analytics systems can process it seamlessly.

* Generating real-time data is about velocity, not variety.

* Storing data over years is about volume.

* Reducing volume is more about data management, not variety.
