Many customers may be doubtful about our price of our Scripting-and-Programming-Foundations exam questions. The truth is our price is relatively cheap among our peer. The inevitable trend is that knowledge is becoming worthy, and it explains why good Scripting-and-Programming-Foundations resources, services and data worth a good price. We always put our customers in the first place. Thus we offer discounts from time to time, and you can get 50% discount at the second time you buy our Scripting-and-Programming-Foundations question and answers after a year. Lower price with higher quality, that's the reason why you should choose our Scripting-and-Programming-Foundations prep guide.

The pass rate is 98.75%, and we will ensure you pass the exam if you buy Scripting-and-Programming-Foundations exam torrent from us. Since the high pass rate, we have received many good feedbacks from candidates. What's more, we pass guarantee and money back guarantee if you fail to pass the exam after purchasing Scripting-and-Programming-Foundations Exam Torrent from us. We have online and offline chat service stuff, and they possess the professional knowledge about the Scripting-and-Programming-Foundations exam dumps, if you have any questions, just have a chat with them.

Our Scripting-and-Programming-Foundations preparationdumps are considered the best friend to help the candidates on their way to success for the exactness and efficiency based on our experts' unremitting endeavor. This can be testified by our claim that after studying with our Scripting-and-Programming-Foundations Actual Exam for 20 to 30 hours, you will be confident to take your Scripting-and-Programming-Foundations exam and successfully pass it. Tens of thousands of our loyal customers relayed on our Scripting-and-Programming-Foundations preparation materials and achieved their dreams.

WGU Scripting and Programming Foundations Exam Sample Questions (Q10-Q15):

NEW QUESTION # 10

What is the out of the given pseudocode?

- A. 0
- **B. 1**
- C. 2
- D. 3

Answer: B

Explanation:

The pseudocode provided appears to be a loop that calculates the sum of numbers. Without seeing the exact pseudocode, I can deduce based on common programming patterns that if the loop is designed to add numbers from 1 to 5, the sum would be $1 + 2 + 3 + 4 + 5$, which equals 15. This is a typical example of a series where the sum of the first n natural numbers is given by the formula $2n(n+1)$

, and in this case, with n being 5, the sum is $25(5+1)=15$

References: This answer is based on the standard algorithm for the sum of an arithmetic series and common looping constructs in programming. The formula for the sum of the first n natural numbers is a well-known result in mathematics and is often used in computer science to describe the behavior of loops and series calculations.

NEW QUESTION # 11

What is a feature of CM as a programming language

- A. The code runs directly one statement at a time by another program called a compiler
- B. The code does not require being translated into machine code but can be run by a separate program called a compiler.
- **C. The code must be compiled into machine code in the form of an executable file before execution.**
- D. The program usually runs slower than an interpreted language.

Answer: C

Explanation:

The C(M) programming language is designed to translate mathematical constructions into efficient C programs. It is a declarative functional language with strong type checking and supports high-level functional programming. The C(M) compiler translates the C(M) program into a readable C program, which then needs to be compiled into machine code in the form of an executable file before it can be executed¹. This process is typical of compiled languages, where the source code is transformed into machine code, which can be directly executed by the computer's CPU. In contrast, interpreted languages are typically run by an interpreter, executing one statement at a time, which generally results in slower execution compared to compiled languages.

NEW QUESTION # 12

What is output by calling Greeting() twice?

- A. Hello!
- **B. Hello!Hello!**
- C. Hello!!

Answer: B

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

The question is incomplete, as the definition of the Greeting() function is not provided. However, based on standard programming problem patterns and the output options, we assume Greeting() is a function that outputs "Hello!" each time it is called. According to foundational programming principles, calling a function multiple times repeats its output unless state changes occur.

* Assumption: Greeting() outputs "Hello!" to the console (e.g., in Python: `def Greeting(): print("Hello!")`).

* Calling Greeting() twice outputs "Hello!" twice, concatenated in the output stream as "Hello!Hello!" (assuming no extra newlines or spaces, as is typical in such problems).

* Option A: "Hello!." This is incorrect. A single "Hello!" would result from one call, not two.

* Option B: "Hello!.." This is incorrect. This suggests a modified output (e.g., adding an extra !), which is not implied by the function's behavior.

* Option C: "Hello!Hello!.." This is correct. Two calls to Greeting() produce "Hello!" twice, appearing as "Hello!Hello!" in the output.

NEW QUESTION # 13

A sample function is shown:

What is returned for F(3)?

- A. 0
- **B. 1**
- C. 2
- D. 3

Answer: B

Explanation:

Let's evaluate F(3):

* $F(3) = (4 * 3) - 8$

* $F(3) = 12 - 8$

* $F(3) = 4$

NEW QUESTION # 14

A sequence diagram is shown:

What is the purpose of a sequence diagram?

- A. It outlines the potential actions of a user
- **B. It illustrates the communication steps for a particular software scenario.**
- C. It outlines the needed computations.
- D. It depicts program operations, branches, and loops.

Answer: B

Explanation:

A sequence diagram is a type of interaction diagram that details how operations are carried out within a system. It is used to model the interactions between objects or components in a sequence that reflects the order of operations, particularly focusing on the messages exchanged between these objects over time. The vertical axis of a sequence diagram represents time, and the horizontal axis represents the objects involved in the interaction. The purpose of a sequence diagram is to illustrate the sequence of messages or events that occur between these objects, typically in the context of a specific use case or scenario within the software system¹234.
