WGU Managing Cloud Security (JY02) Sample Questions (Q71-Q76):

NEW QUESTION # 71
When should a cloud service provider delete customer data?

- A. After the specified retention period
- B. After a scheduled data review
- C. When the data has not been accessed in the last 30 days
- D. When the cloud provider oversubscribes its storage space

Answer: A

Explanation:
The correct time for data deletion is after the specified retention period defined by contractual agreements, regulatory frameworks, or internal policies. Retention policies ensure that data is kept for as long as necessary for business, legal, or compliance reasons but not longer than required.
Oversubscription, inactivity, or review cycles are not valid triggers because they may conflict with compliance mandates such as GDPR, HIPAA, or PCI DSS. Deleting data prematurely could result in legal penalties or business risks, while keeping it longer than necessary could increase exposure.
By deleting data only after the retention period, providers demonstrate adherence to data governance principles and protect customer rights while minimizing storage costs and liability.

NEW QUESTION # 72
Which cloud computing service model allows customers to run their own application code without configuring the server environment?

- A. Software as a service (SaaS)
- B. Infrastructure as a service (IaaS)
- C. Data science as a service (DSaaS)
- D. Platform as a service (PaaS)

Answer: D

Explanation:
Platform as a Service (PaaS) allows customers to focus on writing and deploying code without managing the underlying infrastructure. The provider manages the operating system, runtime, and middleware, enabling faster development cycles and reduced administrative overhead.
IaaS would require the customer to configure servers and operating systems, SaaS provides ready-to-use applications, and DSaaS is a specialized category for analytics.
By abstracting the infrastructure, PaaS accelerates innovation and reduces operational burden but also limits flexibility in some cases. Security responsibilities under PaaS focus on application-level controls, while the provider handles infrastructure-level protections.

NEW QUESTION # 73
Which type of data sanitization should be used to destroy data on a USB thumb drive while keeping the drive intact?

- A. Overwriting
- B. Physical destruction
- C. Degaussing
- D. Key revocation

Answer: A

Explanation:

The correct approach for sanitizing a USB thumb drive while preserving its usability isoverwriting.

Overwriting involves replacing the existing data on the device with random data or specific patterns to ensure that the original information cannot be recovered. This process leaves the physical device intact, allowing it to be reused securely.

Physical destruction, such as shredding, renders the device unusable. Degaussing only works on magnetic media like hard disks or tapes, not on solid-state or flash-based USB drives. Key revocation applies to cryptographic keys and not to physical devices.

By using overwriting, organizations comply with data sanitization standards while balancing operational efficiency. Many tools exist that perform multi-pass overwrites to meet regulatory requirements such as those from NIST or ISO. This ensures that sensitive data is removed while allowing the device to remain in circulation for continued use.

NEW QUESTION # 74

Which steps should an organization take to avoid risk when dealing with software licensing?

- A. It should ensure it only uses open-source licenses.
- B. It should ensure it only uses closed-source licenses.
- C. It should ensure it has the correct location to store licenses.
- D. It should ensure it has the correct type of license.

Answer: D

Explanation:
The primary safeguard against licensing risk is ensuring the organization has thecorrect type of license.

Software licenses define usage rights, limitations, and legal obligations. Using software outside of license terms can lead to legal penalties, financial fines, and reputational damage.

Location of licenses is a management issue, not a risk control. Restricting usage to closed-source or open- source alone is not practical, as both models require compliance with license agreements.

Correct licensing includes verifying user counts, subscription terms, geographic restrictions, and intended use.

It also involves monitoring for unauthorized installations and conducting regular audits. Proper license management ensures legal compliance, cost control, and operational continuity.

NEW QUESTION # 75

As part of an e-discovery process, an employee needs to identify all documents that contain a specific phrase.
Which type of discovery method should the employee use to identify these documents?

- A. Metadata-based
- B. Label-based
- C. Content-based
- D. Location-based

Answer: C

Explanation:
Content-based discoveryinvolves searching within the actual text or binary content of documents to find matches for keywords, phrases, or patterns. In e-discovery, when the requirement is to locate documents containing a specific phrase, searching based on content is the most direct and reliable method.

Other approaches, such as metadata-based discovery, only examine properties like creation date or author, which do not reveal the presence of specific text. Label-based discovery relies on pre-applied classification labels, which may not always be accurate.

Location-based discovery limits searches to folders or storage locations but does not guarantee relevance.

Content-based discovery provides completeness in legal and regulatory investigations. It ensures that no relevant documents are overlooked simply because of inconsistent labeling or metadata, thus supporting compliance and defensibility in court proceedings.
