

Ping Identity PAP-001 Valid Test Pass4sure - PAP-001 Exam Simulator Fee

DOWNLOAD the newest Pass4Leader PAP-001 PDF dumps from Cloud Storage for free: <https://drive.google.com/open?id=1d-vU5YivxzTDsEVLjvJx-ukuL-14Ha98>

Considering all customers' sincere requirements, PAP-001 test question promise to our candidates with plenty of high-quality products, considerate after-sale services. Numerous advantages of PAP-001 training materials are well-recognized, such as 99% pass rate in the exam, free trial before purchasing, secure privacy protection and so forth. From the customers' perspective, We treasure every customer's reliance and feedback to the optimal PAP-001 Practice Test and be the best choice.

Ping Identity PAP-001 Exam Syllabus Topics:

Topic	Details
Topic 1	<ul style="list-style-type: none"> • Installation and Initial Configuration: This section of the exam measures skills of System Engineers and reviews installation prerequisites, methods of installing or removing PingAccess, and securing configuration database passwords. It explains the role of run.properties entries and outlines how to set up a basic on-premise PingAccess cluster.
Topic 2	<ul style="list-style-type: none"> • Policies and Rules: This section of the exam measures the skills of Security Administrators and focuses on how PingAccess evaluates paths for applying policies and resources. It covers the role of different rule types, their configuration, and the implementation of rule sets and rule set groups for consistent policy enforcement.
Topic 3	<ul style="list-style-type: none"> • General Maintenance and File System: This section of the exam measures the skills of System Engineers and addresses maintenance tasks such as license management, backups, configuration imports or exports, auditing, and product upgrades. It also includes the purpose of log files and an overview of the PingAccess file system structure with important configuration files.

High-quality PAP-001 Valid Test Pass4sure Covers the Entire Syllabus of PAP-001

The immediate downloading feature of our PAP-001 study materials is an eminent advantage of our products. Once the pay is done, our customers will receive an e-mail from our company. There is a linkage given by our e-mail, and people can begin their study right away after they have registered in. Our PAP-001 study materials are available for downloading without any other disturbing requirements as long as you have paid successfully, which is increasingly important to an examinee as he or she has limited time for personal study. Therefore, our PAP-001 Study Materials are attributive to high-efficient learning.

Ping Identity Certified Professional - PingAccess Sample Questions (Q67-Q72):

NEW QUESTION # 67

What is the purpose of the `admin.authconfiguration` setting?

- A. To configure SSO for the administrative user interface.
- **B. To override the SSO configuration for the administrative user interface.**
- C. To define the method to use for authenticating to the administrative API.
- D. To enable automatic authentication to the PingAccess administrative console.

Answer: B

Explanation:

The `admin.authsetting` in the `run.properties` file is used to specify a fallback authentication method for the administrative console.

Exact Extract from official documentation:

"To define a fallback administrator authentication method if the OIDC token provider is unreachable, enable the `admin.auth=``native` property in the `run.properties` file. This overrides any configured administrative authentication to basic authentication." This makes it clear that the purpose of `admin.auth` is to override any configured SSO for the admin UI and enforce native (basic) authentication instead.

* Option A is incorrect because `admin.authsetting` does not configure SSO. SSO for the admin UI is configured separately.

* Option B is incorrect because this setting does not apply to the administrative API; it specifically applies to the admin UI console.

* Option C is correct because it directly reflects the documented behavior: `admin.auth` overrides SSO configuration for the administrative UI and enables native authentication.

* Option D is incorrect because the setting does not enable automatic authentication. It still requires credentials, but falls back to basic auth.

Reference: PingAccess User Interface Reference Guide - Configuring Admin UI SSO Authentication

NEW QUESTION # 68

Any user who accesses an application must be in sales unless the user is a manager in the marketing department. The administrator creates the following web session rules:

- * (A) Look for `department = sales`
- * (B) Look for `department = marketing`
- * (C) Look for `job_title = manager`

Which additional actions should be taken to properly enforce this requirement?

- A. Create a Rule Set (D) to accept ALL (A) # Create a Rule Set (E) to accept ANY (B) (C) # Create a Rule Set Group (F) to accept ALL (D) (E) # Add Rule Set Group (F) to the resource
- B. Create a Rule Set (D) to accept ALL (A) (B AND C) # Add Rule Set (D) to the resource
- **C. Create a Rule Set (D) to accept ANY (A) # Create a Rule Set (E) to accept ALL (B) (C) # Create a Rule Set Group (F) to accept ANY (D) (E) # Add Rule Set Group (F) to the resource**
- D. Create a Rule Set (D) to accept ANY (A) (B) (C) # Add Rule Set (D) to the resource

Answer: C

Explanation:

The requirement is:

- * Allow access if user is in sales
- * OR if user is in marketing AND is a manager

This is logically represented as:

(A) OR (B AND C)

To configure this in PingAccess:

- * Rule Set (D) = ANY (A)
- * Rule Set (E) = ALL (B, C)
- * Rule Set Group (F) = ANY (D, E)
- * Assign Group (F) to the resource

This exactly matches Option D.

- * Option A is incorrect - requires both A and (B AND C), which is stricter than the requirement.
- * Option B is incorrect - ANY(A, B, C) would allow users in marketing or managers without requiring both.
- * Option C is incorrect - it uses ALL(D, E), which would require both conditions instead of OR.
- * Option D is correct - it models (A OR (B AND C)).

NEW QUESTION # 69

All style sheets should be accessible to all users without authentication across all applications. Which configuration option should the administrator use?

- A. Define a Protocol Source for the resource.
- B. Define a Default Availability Profile of on-demand for the resource.
- **C. Define Global Unprotected Resources for the resource.**
- D. Define Authentication Challenge Policy of none for the resource.

Answer: C

Explanation:

The correct way to ensure resources such as CSS files, images, or JavaScript are accessible without authentication across all applications is to configure Global Unprotected Resources.

Exact Extract:

"Global unprotected resources define resources that do not require authentication and are accessible to all clients across applications."

- * Option A is incorrect; Protocol Sources define back-end host connections, not authentication.
- * Option B would apply only per-resource, not across all applications.
- * Option C is correct - Global Unprotected Resources are designed for this exact purpose.
- * Option D (Availability Profile) is related to application health checks and availability, not authentication.

Reference: PingAccess Administration Guide - Global Unprotected Resources

NEW QUESTION # 70

An administrator is integrating a new PingAccess Proxied Application. The application will use an SSL certificate issued by a publicly trusted Certificate Authority. PingAccess is terminating SSL and is responsible for loading the SSL certificate for that application. What initial action must the administrator take in PingAccess in this situation?

- **A. Import the PKCS#12 file with the full certificate chain into the Key Pairs.**
- B. Import the SSL public key with the full certificate chain into the Certificates.
- C. Import the PKCS#12 file with the full certificate chain into the Certificates.
- D. Import the SSL public key with the full certificate chain into the Key Pairs.

Answer: A

Explanation:

For PingAccess to terminate SSL for a proxied application, it requires access to the private key and certificate chain. These are stored as Key Pairs.

Exact Extract:

"For SSL termination, you must import the server certificate and its private key as a PKCS#12 file into Key Pairs."

- * Option A is incorrect - a public key alone cannot terminate SSL.
- * Option B is incorrect - PKCS#12 files must go into Key Pairs, not Certificates.
- * Option C is incorrect - public keys alone are insufficient; PingAccess must have the private key.
- * Option D is correct - the PKCS#12 file with full chain and private key is imported into Key Pairs.

Reference: PingAccess Administration Guide - Managing Certificates and Key Pairs

NEW QUESTION # 71

Users report the following about access to an application:

- * Inconsistent behavior depending on the browser used
- * Denied access
- * Prompt to accept a security exception

Which configuration option should the administrator adjust?

- A. Validate Session
- B. Enable PKCE
- C. SameSite Cookie
- D. Request Preservation

Answer: C

Explanation:

Modern browsers enforce stricter cookie handling rules. If cookies are not configured correctly with the SameSite attribute, behavior can differ across browsers, leading to inconsistent authentication and access denials. Security exceptions may appear when session cookies are blocked.

Exact Extract:

"The SameSite cookie setting defines how browsers send cookies in cross-site requests. Misconfigured SameSite values can lead to inconsistent application behavior across browsers."

- * Option A (Enable PKCE) is related to OAuth flow security, not browser cookie behavior.
- * Option B (SameSite Cookie) is correct - this directly explains the inconsistent browser issues.
- * Option C (Request Preservation) ensures query parameters are kept, not related to cross-browser session handling.
- * Option D (Validate Session) checks session state but does not address browser inconsistencies.
