

# Actual PDII Exam Questions - PDII Free Demo & PDII Valid Torrent

What's more, part of that Pass4Test PDII dumps now are free: <https://drive.google.com/open?id=12iNBFUYdD0LTqwk73qS7o4GYK6-HhUwF>

When you are studying for the PDII exam, maybe you are busy to go to work, for your family and so on. How to cost the less time to reach the goal? It's a critical question for you. Time is precious for everyone to do the efficient job. If you want to get good PDII prep guide, it must be spending less time to pass it. Exactly, our product is elaborately composed with major questions and answers. We are choosing the key from past materials to finish our PDII Guide Torrent. It only takes you 20 hours to 30 hours to do the practice. After your effective practice, you can master the examination point from the PDII exam torrent. Then, you will have enough confidence to pass it.

The PDII exam covers a wide range of topics related to advanced development techniques, such as Apex programming, Visualforce development, Lightning components, and integration with external systems. PDII exam consists of 60 multiple-choice questions and is timed at 120 minutes. To pass the exam, candidates must score at least 65%.

Salesforce PDII (Salesforce Certified Platform Developer II (PDII)) exam is designed to test the skills and knowledge of experienced developers in Salesforce. PDII Exam focuses on advanced programming concepts and techniques that are necessary to build complex applications on the Salesforce platform. Passing PDII exam demonstrates that a developer has the expertise to design and implement complex solutions that meet the needs of organizations using Salesforce.

## PDII Downloadable PDF - PDII Exam Dumps Provider

Our test-orientated high-quality PDII exam questions would be the best choice for you, we sincerely hope all of our candidates can pass PDII exam, and enjoy the tremendous benefits of our PDII prep guide. Helping candidates to pass the PDII Exam has always been a virtue in our company's culture, and you can connect with us through email at the process of purchasing and using, we would reply you as fast as we can.

Preparing for the PDII exam requires a significant investment of time and effort. Developers must have a deep understanding of the Salesforce platform, as well as strong technical skills in Apex programming language and related development tools. However,

earning the PDII Certification can be a game-changer for developers looking to distinguish themselves in the competitive Salesforce job market and advance their careers to the next level.

## Salesforce Platform Developer II Sample Questions (Q65-Q70):

### NEW QUESTION # 65

A developer is writing a Visualforce page that queries accounts in the system and presents a data table with the results. The users want to be able to filter the results based on up to five fields. However, the users want to pick the five fields to use as filter fields when they run the page. Which Apex code feature is required to facilitate this solution?

- A. Variable binding
- B. Metadata API
- C. Streaming API
- **D. Dynamic SOQL**

**Answer: D**

Explanation:

The requirement is to allow users to select which fields they want to filter by at runtime. In standard (static) SOQL, the fields in the WHERE clause must be defined at compile time (e.g., WHERE Name = :val).

Because the fields themselves are not known until the user interacts with the page, the developer cannot write a static query.

Dynamic SOQL is the required feature. It allows the developer to construct the SOQL query string as a text string at runtime, incorporating the specific field names selected by the user, and then execute that string using Database.query(queryString). This provides the flexibility to build queries on the fly based on user input. Metadata API is for configuration changes, Streaming API is for push notifications, and Variable binding (:var) is used in both static and dynamic SOQL but does not solve the issue of changing the field names themselves.

### NEW QUESTION # 66

An org has a requirement that addresses on Contacts and Accounts should be normalized to a company standard by Apex code any time that they are saved. What is the optimal way to implement this?

- A. Apex triggers on Contact and Account that normalize the address
- B. Apex trigger on Account that calls the Contact trigger to normalize the address
- **C. Apex triggers on Contact and Account that call a helper class to normalize the address**
- D. Apex trigger on Contact that calls the Account trigger to normalize the address

**Answer: C**

Explanation:

In software engineering, the DRY (Don't Repeat Yourself) principle is fundamental for maintainability. If the logic for normalizing an address is identical for both Accounts and Contacts, that logic should not be duplicated across two separate trigger files.

The optimal implementation (Option D) is to create a single Trigger Helper or Utility class. This class contains a static method (e.g., AddressService.normalize(List<sObject> records)) that performs the normalization logic. You then create a small trigger on the Account object and a small trigger on the Contact object, both of which simply invoke this shared helper method.

This approach offers several advantages:

\* Maintainability: If the company standard for addresses changes (e.g., changing "St." to "Street"), the developer only needs to update the code in one place.

\* Reusability: The helper method can also be called from other contexts, such as an Anonymous Apex script or a Batch job.

\* Readability: Triggers remain "thin" and easy to read, acting only as entry points rather than containing complex business logic.

Options B and C are technically impossible; a trigger on one object cannot "call" a trigger on another object directly. Option A is less optimal because it leads to code duplication and a higher risk of bugs when logic is updated in one trigger but forgotten in the other.

### NEW QUESTION # 67

Which of these are valid REST annotations?

- **A. @httpDelete**
- B. @httpCreate
- C. @httpUpsert

- D. @httpPatch

Answer: A,D

### NEW QUESTION # 68

A developer created a Lightning web component for the Account record page that displays the five most recently contacted Contacts for an Account. The Apex method, Contacts, returns a list of Contacts and will be wired to a property in the component.

```

01:
02: public class ContactSalesforce
03:
04:     static List<Contact> getRecentContacts(Id accountId) {
05:         List<Contact> contacts = getFiveMostRecent(accountId);
06:         return contacts;
07:     }
08:
09:     private static List<Contact> getFiveMostRecent(Id accountId) {
10:         //...implementation...
11:     }
12: }

```

Which two lines must change in the above code to make the Apex method able to be wired?

Choose 2 answers

- A. Add @AuraEnabled {cacheable=true} to line 03.
- B. Add @AuraEnabled {cacheable=true} to line 08.
- C. Add public to line 04.
- D. Remove private from line 09.

Answer: A,C

Explanation:

To make the Apex method able to be wired, the developer should change two lines in the code: add public to line 04, and add @AuraEnabled(cacheable=true) to line 03. Adding public to line 04 makes the Apex method accessible from outside the class, which is required for the @wire decorator to invoke the method. Adding @AuraEnabled(cacheable=true) to line 03 makes the Apex method cacheable, which means that the method can be invoked by a Lightning web component that uses the @wire decorator. This also improves the performance of the component, as it reduces the number of server trips and leverages the client-side cache. The developer should use this annotation for methods that return data that does not change frequently or does not depend on the user context. Adding @AuraEnabled(cacheable=true) to line 08 is not necessary, as the cacheable attribute only applies to the top-level method that is invoked by the @wire decorator, not to the helper methods that are called within the class. Removing private from line 09 is not necessary, as the helper method can be private as long as it is called from within the class. Reference: [Call Apex Methods from Lightning Web Components], [Marking Methods as Storable or Cacheable]

### NEW QUESTION # 69

An org records customer order information in a custom object, Order\_\_c, that has fields for the shipping address. A developer is tasked with adding code to calculate shipping charges on an order, based on a flat percentage rate associated with the region of the shipping address.

What should the developer use to store the rates by region, so that when the changes are deployed to production no additional steps are needed for the calculation to work?

- A. Custom object
- B. Custom list setting
- C. Custom metadata type
- D. Custom hierarchy setting

Answer: C
