An employee reports that their spreadsheet application crashes every time they attempt to load a particularly large file. What is the first step they should take to resolve this issue?

- A. Change the format of the spreadsheet file
- B. Uninstall and reinstall the spreadsheet application
- C. Upgrade to a newer version of the spreadsheet application
- **D. Check if their device meets the application's system requirements**

정답: D

설명:

Correct Answer: B. Check if their device meets the application's system requirements Ensuring that the device meets the minimum system requirements of the application is critical, especially when dealing with large files that may require more resources.

Option A is incorrect because uninstalling and reinstalling the application should be considered only after simpler checks, like system requirements, have been verified.

Option C is incorrect as upgrading the application does not necessarily resolve a resource constraint issue.

Option D is incorrect because changing the file format might not address the underlying issue if the application is struggling due to resource limitations.

질문 # 486

What should be considered when resetting a password to ensure it complies with best security practices?

- A. Use the user's name or part of their email as the password
- **B. Ensure the password includes a mix of letters, numbers, and symbols**
- C. Set a password that is easy to remember, such as "12345"
- D. Set the password to never expire

정답: B

설명:

Correct Answer. C. Ensure the password includes a mix of letters, numbers, and symbols Creating a strong password that includes a combination of letters, numbers, and symbols enhances security by making it more difficult for unauthorized individuals to guess or crack.

Option A is incorrect because using simple or common sequences like "12345" is insecure and easily guessable.

Option B is incorrect as using personal information such as the user's name or email part makes the password vulnerable to targeted attacks.

Option D is incorrect because passwords should be set to expire after a certain period to reduce the risk of long-term exposure from a possibly compromised password.

- A. Check the scanner's USB or network connection to ensure it is secure
- B. Reboot the workstation and scanner to reset the connection
- C. Update the scanner driver software immediately
- D. Replace the scanner with a new one

정답 : A

설명:

Correct Answer. C. Check the scanner's USB or network connection to ensure it is secure The first step should always be to check the physical connections as these are often the simplest and most common cause of connectivity issues. Loose or disconnected cables can prevent the scanner from being recognized.

Option A is incorrect. Rebooting the devices is a valid troubleshooting step but should follow checking the physical connections.

Option B is incorrect. Replacing the scanner is premature without first ensuring that simpler fixes, like checking connections, are not effective.
