Amazon AWS Certified Cloud Practitioner 認定 CLF-C02 試験問題 (Q383-Q388):

質問 # 383

Which task is the customer's responsibility, according to the AWS shared responsibility model?

- **A. Patch a guest operating system that is deployed on an Amazon EC2 instance.**
- B. Patch a host operating system that is deployed on Amazon S3.
- C. Control physical access to an AWS data center
- D. Control access to AWS underlying hardware.

正解: A

質問 # 384

A company has developed a distributed application that recovers gracefully from interruptions. The application periodically processes large volumes of data by using multiple Amazon EC2 instances. The application is sometimes idle for months. Which EC2 instance purchasing option is MOST cost-effective for this use case?

- **A. Spot Instances**
- B. On-Demand Instances
- C. Reserved Instances
- D. Dedicated Instances

正解: A

解説:

Spot Instances are instances that use spare EC2 capacity that is available for up to 90% off the On-Demand price. Because Spot Instances can be interrupted by EC2 with two minutes of notification when EC2 needs the capacity back, you can use them for applications that have flexible start and end times, or that can withstand interruptions. This option is most cost-effective for the use case described in the question. Reserved Instances are instances that you purchase for a one-year or three-year term, and pay a lower hourly rate compared to On-Demand Instances. This option is suitable for applications that have steady state or predictable usage.

Dedicated Instances are instances that run on hardware that's dedicated to a single customer within an Amazon VPC. This option is suitable for applications that have stringent regulatory or compliance requirements.

On-Demand Instances are instances that you pay for by the second, with no long-term commitments or upfront payments. This option is suitable for applications that have unpredictable or intermittent workloads.

質問 # 385

Which AWS service should a company use to organize, characterize, and search large numbers of images?

- A. Amazon Transcribe
- **B. Amazon Rekognition**
- C. Amazon Aurora
- D. Amazon QuickSight

正解: B

解説:

Amazon Rekognition is a machine learning service that can analyze and recognize objects, people, text, scenes, and activities in images and videos. It is specifically designed for organizing, categorizing, and searching large volumes of images based on various attributes. Amazon Transcribe is for speech-to-text, Amazon Aurora is a relational database service, and Amazon QuickSight is a business intelligence tool for data visualization.

質問 # 386

A company needs a fully managed file server that natively supports Microsoft workloads and file systems. The file server must also

support the SMB protocol.

Which AWS service should the company use to meet these requirements?

- A. Amazon FSx for Lustre
- B. Amazon Elastic Block Store (Amazon EBS)
- C. Amazon Elastic File System (Amazon EFS)
- **D. Amazon FSx for Windows File Server**

正解: D

解説:

Amazon FSx for Windows File Server is a fully managed file server that supports Microsoft workloads and file systems, including the SMB protocol. It provides features such as user quotas, end-user file restore, and Microsoft Active Directory integration. Amazon EFS is a fully managed file system that supports the NFS protocol, not SMB. Amazon FSx for Lustre is a fully managed file system that supports high-performance computing workloads, not Microsoft workloads. Amazon EBS is a block storage service that does not provide a file system or SMB support. Reference: Amazon FSx for Windows File Server, Amazon FSx for Lustre, Amazon EFS, Amazon EBS

質問 # 387

Which AWS service will help a company identify the user who deleted an Amazon EC2 instance yesterday?

- A. Amazon Inspector
- B. Amazon CloudWatch
- **C. AWS CloudTrail**
- D. AWS Trusted Advisor

正解: C

解説:

The correct answer is C because AWS CloudTrail is a service that will help a company identify the user who deleted an Amazon EC2 instance yesterday. AWS CloudTrail is a service that enables users to track user activity and API usage across their AWS account. AWS CloudTrail records the details of every API call made to AWS services, such as the identity of the caller, the time of the call, the source IP address of the caller, the parameters and responses of the call, and more. Users can use AWS CloudTrail to audit, monitor, and troubleshoot their AWS resources and actions. The other options are incorrect because they are not services that will help a company identify the user who deleted an Amazon EC2 instance yesterday. Amazon CloudWatch is a service that enables users to collect, analyze, and visualize metrics, logs, and events from their AWS resources and applications. AWS Trusted Advisor is a service that provides real-time guidance to help users follow AWS best practices for security, performance, cost optimization, and fault tolerance.

Amazon Inspector is a service that helps users find security vulnerabilities and deviations from best practices in their Amazon EC2 instances. Reference: AWS CloudTrail FAQs
