## EMC Dell PowerEdge Foundations v2 Exam Sample Questions (Q75-Q80):

### NEW QUESTION # 75

Which server attribute refers to its ability to undergo maintenance and repairs without causing system downtime?

- A. Serviceability
- **B. High availability**
- C. Reliability
- D. Scalability

**Answer: B**

Explanation:

High availability refers to a server's design that allows maintenance, repairs, and upgrades without interrupting operations, achieved through redundant components like power supplies, fans, and hot-swappable parts. This ensures continuous uptime critical for business environments. Reliability focuses on failure resistance, serviceability on ease of repair, and scalability on expansion. High availability is key for mission-critical PowerEdge servers. Exact extract: "Define the characteristics of a server... Explain the power distribution considerations... Describe maintenance functions, shutdowns, reboots of a PowerEdge Server." Reference: Dell PowerEdge Foundations v2 Exam Description (D-PE-FN-01), Topic: Introduction to Servers (28%) and Maintenance (18%).

#### NEW QUESTION # 76

What is the primary objective of pairs Multi Vector Cooling technology in server platforms?

- A. Maximize server processing power at any temperature
- **B. Manage thermal controls through a multi-faceted strategy**
- C. Achieve complete Fanless operation in servers
- D. Implement complex liquid cooling solutions in all servers

**Answer: B**

#### NEW QUESTION # 77

In a virtual environment, what is the host operating system's role in managing network traffic when an external switch is used?

- A. Manage only internal communication between virtual machines
- **B. See the traffic and share the pNIC with VMs for external communication**
- C. Isolate the host completely from network traffic flow
- D. Delegate all traffic management directly to the external switch itself

**Answer: B**

#### NEW QUESTION # 78

In a hot aisle/cold aisle data center layout, where is the hot air exhausted from server racks primarily directed?

- A. Vented directly into the cold aisle for mixing
- B. Recirculated within the server rack for preheating
- **C. Routed to the air handling system for cooling**
- D. Exhausted directly out of the data center building

**Answer: C**

Explanation:

In a hot aisle/cold aisle layout, hot air exhausted from PowerEdge server racks is primarily directed to the air handling system (e.g., CRAC units) for cooling and recirculation. This design prevents hot air from mixing with cold air, maintaining efficient cooling. Recirculating within racks or venting to the cold aisle would reduce efficiency, and direct exhaust outside is impractical. Exact extract: "Explain the cooling and thermal considerations in PowerEdge Servers (Direct Liquid Cooling, Immersion Cooling, Air Cooling)... Describe maintenance functions, shutdowns, reboots of a PowerEdge Server." Reference: Dell PowerEdge Foundations v2 Exam Description (D-PE-FN-01), Topic: Maintenance (18%).

#### NEW QUESTION # 79

A data center operator implements security best practices and must ensure that user access to server management functions is strictly controlled and separate from regular data access paths.

How do out-of-band (OOB) management applications enhance security by design compared to in-band methods?

- A. OOB applications seek separation of data I/O from management I/O and restrict user access to the management application by way of the operating system
- B. OOB applications integrate user access within the operating system security model and use ABAC to control access to the resources
- C. OOB applications rely on m-band operating system utilities for access restriction and use their inherent capabilities
- D. OOB applications centralize all user access through a single OS login based on the capabilities that the operating system provides

**Answer: A**
