## Understanding functional and technical aspects of CompTIA Cloud Essentials+ (CLO-002) Governance, Risk, Compliance and Security for the Cloud

The following will be discussed in **COMPTIA CLO-002 Exam Dumps Pdf**:

- Deduplication
- Network
- IoT
- Capacity on demand
- High availability
- Backup
- Monitoring and visibility
- Self-service
- Social media
- Containerization
- Blockchain
- Optimization
- Orchestration

- Machine learning
- Alerts
- VDI
- Resource tagging
- Lift and shift
- Right-sizing
- Storage
- Maintenance
- Identity access management
- Hybrid
- Regression testing
- Locality
- Testing in QA environments
- Sandboxing
- Email campaigns
- Infrastructure as code
- Reserved
- Rip and replace
- Understand risk management and response concepts related to cloud services and identify the importance and impacts of compliance in the cloud, such as regulatory concerns or international standards
- Storage features
- Continuous delivery
- Logging
- Compute
- Cloud-native applications
- RPO
- File storage
- API integration
- Continuous integration/
- Hot vs. cold
- Block storage
- Object storage
- Digital marketing
- Storage types
- Upgrades and patching
- Performance
- Auto-scaling
- Data management
- Recovery objectives
- Phased
- Disposable resources
- Compression
- Templates
- Licensing type
- Automation
- Availability

Attending RealVCE, you will have best exam dumps for the certification of CLO-002 exam tests. We offer you the most accurate CLO-002 exam answers that will be your key to pass the certification exam in your first try. There are the best preparation materials for your CLO-002 Practice Test in our website to guarantee your success in a short time. Please totally trust the accuracy of questions and answers.

CompTIA CLO-002: CompTIA Cloud Essentials+ Certification exam is designed to validate the basic knowledge and understanding of cloud computing concepts and terminology. It is an entry-level, vendor-neutral certification that is ideal for individuals who are looking to develop their skills in cloud computing. CLO-002 Exam covers a range of topics such as cloud service models, cloud deployment models, security and compliance, and business continuity and disaster recovery.

### CompTIA Cloud Essentials+ Certification Exam Sample Questions (Q62-Q67):

#### NEW QUESTION # 62

The administrator of a new e-commerce company is evaluating the options to optimize the performance of the platform at runtime based on the service utilization levels. Which of the following optimization techniques would help to adjust the performance requirements?

- A. Autoscaling
- B. Right-sizing
- C. Geo-redundancy
- D. Deduplication

**Answer: A**

Explanation:

Autoscaling is a cloud optimization technique that automatically adjusts the amount of resources (such as compute or storage) based on current utilization levels. It ensures that the platform has enough resources during periods of high demand and reduces resources when demand is low, thereby optimizing performance at runtime and cost efficiency.

#### NEW QUESTION # 63

Which of the following DevOps options is used to integrate with cloud solutions?

- A. Automation
- B. Provisioning
- C. API
- D. SOA

**Answer: C**

Explanation:

API stands for Application Programming Interface, which is a set of rules and protocols that allow different software components or systems to communicate and exchange data. API is used to integrate with cloud solutions because it enables developers to access the cloud services and resources programmatically, without having to deal with the underlying infrastructure or platform details. API also allows for automation, scalability, and interoperability of cloud applications and services.

#### NEW QUESTION # 64

An analyst is reviewing a report on a company's cloud resources expenditures. The analyst has noted that a data warehouse team uses a significant amount of high-speed storage for live databases and backups. Which of the following should the analyst recommend for improved cost and efficiency?

- A. Move the backups to slower storage.
- B. Configure geo-redundancy for backups.
- C. Move the backups to another availability zone.
- D. Configure the live database for redundant clustering.

**Answer: A**

Explanation:

High-speed storage, such as solid-state drives (SSDs), is more expensive and faster than slower storage, such as hard disk drives (HDDs). High-speed storage is suitable for live databases that require low latency and high performance, but not for backups that are rarely accessed and do not need fast retrieval. Therefore, the analyst should recommend moving the backups to slower storage, which can reduce the cost and improve the efficiency of the cloud resources expenditures. Moving the backups to slower storage can also free up more space for the live database on the high-speed storage<sup>1</sup>.

Configuring the live database for redundant clustering, configuring geo-redundancy for backups, or moving the backups to another availability zone are not recommended for improved cost and efficiency, as they would increase the complexity and expense of the cloud resources. Redundant clustering and geo-redundancy are techniques for enhancing the availability and reliability of the data, but they also require more storage and network resources<sup>2</sup>. Moving the backups to another availability zone may improve the fault tolerance and latency of the backups, but it may also incur additional fees for data transfer and storage<sup>3</sup>. #### NEW QUESTION # 65

Which of the following is a benefit of cloud computing?

- **A. Cloud computing delivers IT capabilities that scale with demand.**
- B. Cloud computing negates the need for a procurement department.
- C. Cloud computing delivers a wide range of services that are easily accessible to users
- D. Cloud computing delivers IT capacity on demand.

**Answer: A**

#### NEW QUESTION # 66

Which of the following BEST describes how a cloud provider helps a company with security risk responses?

- A. Mitigation
- B. Acceptance
- C. Avoidance
- **D. Transference**

**Answer: D**

Explanation:

Transference is the best description of how a cloud provider helps a company with security risk responses. Transference means shifting the responsibility or liability for the risk to another party, such as an insurance company or a cloud service provider (CSP). By using a CSP, the company can transfer some of the security risks to the provider, who has more expertise and resources to manage them. However, the company still retains the ownership and accountability for the data and applications hosted in the cloud, and must ensure that the CSP meets the agreed-upon service level agreements (SLAs) and security standards. The company cannot transfer all the security risks to the CSP, as some risks are inherent to the cloud environment, such as data breaches, misconfigurations, or compliance violations<sup>1,2</sup>.
