Salesforce Accredited B2B Commerce Developer Sample Questions (Q103-Q108):

NEW QUESTION # 103

Which method signature is used in the Global API's?

- A. Changes based on API and Method name
- B. List<List<Object>>
- C. ccrz.cc_Output (ccrzc Input input)
- D. Map<String, Object>

Answer: C

Explanation:

The method signature that is used in the Global API's is `ccrz.cc_Output (ccrz.cc_Input input)`. This signature indicates that the Global API methods take a single input parameter of type `ccrz.cc_Input` and return an output of type `ccrz.cc_Output`. These are custom classes that are defined in the cloudcraze managed package and contain various properties and methods for handling the input and output data. For example, `ccrz.ccServiceProduct.getProducts(ccrz.cc_Input input)` is a Global API method that takes an input object and returns an output object containing product data. NEW QUESTION # 104

Which method is used to override when extending the Salesforce B2B Commerce logic providers?

- A. **doAction**
- B. doLogic
- C. fetch
- D. process

Answer: A

Explanation:

Explanation

The method that is used to override when extending the Salesforce B2B Commerce logic providers is `doLogic`.

This method is responsible for executing the business logic for each logic provider class, such as validating inputs, performing calculations, applying rules, or updating data. By overriding this method, the user can modify or extend the existing logic or add their own custom logic. Salesforce References: B2B Commerce and D2C Commerce Developer Guide, Logic Classes

NEW QUESTION # 105

In which three ways should useful debugging information in Salesforce B2B Commerce implementation be garnered? (3 answers) A) Enabling the logging token via

- A. Placing a `System.debug()` statement anywhere in the class being debugged.
- B. **Admin and subsequently inspecting the logs via the browser console.**
- C. **Logging into the community as a system administrator to identify any potential permissions or Visualforce exceptions.**
- D. **Enabling debugging options for the current user and visually inspecting the Salesforce debug logs.**
- E. Logging a case with Salesforce support to enable advanced debugging options.

Answer: B,C,D

Explanation:

Useful debugging information in Salesforce B2B Commerce implementation can be garnered in three ways:

* Enabling the logging token via Admin and subsequently inspecting the logs via the browser console.

This will enable logging messages and errors to the browser console, which can be viewed by opening the Developer Tools in the browser. The logging token can be enabled by setting the value of `CO.logToken` to true in `CCAdmin`.

* Enabling debugging options for the current user and visually inspecting the Salesforce debug logs. This will enable logging messages and errors to the Salesforce debug logs, which can be viewed by opening the Debug Logs page in Salesforce Setup. The debugging options can be enabled by creating a Debug Level and a Trace Flag for the current user in Salesforce Setup.

* Logging into the community as a system administrator to identify any potential permissions or Visualforce exceptions. This will allow viewing any errors or warnings that may occur on the community pages due to insufficient permissions or Visualforce issues. The system administrator can also access `CCAdmin` and other tools from within the community. Salesforce References: B2B Commerce and D2C Commerce Developer Guide, Logging, Debug Your Code

NEW QUESTION # 106

What is the fastest route to setting up a B2B Commerce Store as a developer?

- A. Create a new store in the Commerce app
- B. **Use sfdx setup scripts**
- C. Set up B2B Commerce on Lightning Experience manually

- D. Import a previously exported store archive

Answer: B

Explanation:

The fastest route to setting up a B2B Commerce store as a developer is to use sfdx setup scripts. Sfdx setup scripts are scripts that use Salesforce CLI commands to automate the creation and configuration of a B2B Commerce store. The scripts can perform tasks such as creating scratch orgs, installing packages, importing data, assigning permissions, and deploying code. The scripts can save time and effort for developers who need to set up a B2B Commerce store quickly and easily. Setting up B2B Commerce on Lightning Experience manually is not the fastest route to setting up a B2B Commerce store, as it involves many steps and actions that can be tedious and error-prone. Creating a new store in the Commerce app is not the fastest route either, as it also requires manual configuration and customization of various settings and features. Importing a previously exported store archive is not the fastest route either, as it depends on the availability and quality of the store archive and may not reflect the latest changes or updates. NEW QUESTION # 107

Which three data types are supported for custom fields while using CSV file format for importing data for a store?

- A. Currency
- B. Picklist (Multi-Select)
- C. Lookup Relationship
- D. Text Area(Long)
- E. Address

Answer: A,C,D

Explanation:

Three data types that are supported for custom fields while using CSV file format for importing data for a store are Text Area(Long), Lookup Relationship, and Currency. A custom field is a field that is added by a developer or an administrator to an object to store additional information or data. A data type is a property that defines the type, format, and validation rules of a field. A CSV file is a file format that stores tabular data in plain text using commas to separate values. A store is a record that represents a B2B or B2C storefront in Salesforce. Text Area(Long) is a data type that allows users to enter up to 131,072 characters on separate lines. Text Area(Long) is supported for custom fields while using CSV file format for importing data for a store. Lookup Relationship is a data type that allows users to create a relationship between two objects and select a value from another record. Lookup Relationship is supported for custom fields while using CSV file format for importing data for a store. Currency is a data type that allows users to enter currency values and automatically convert them based on the user's locale and currency settings. Currency is supported for custom fields while using CSV file format for importing data for a store. Picklist (Multi-Select) is a data type that allows users to select one or more values from a predefined list of values. Picklist (Multi-Select) is not supported for custom fields while using CSV file format for importing data for a store. Address is a data type that allows users to enter address values and automatically format them based on the user's locale settings.

Address is not supported for custom fields while using CSV file format for importing data for a store.
