WGU Digital Forensics in Cybersecurity (D431/C840) Course Exam Sample Questions (Q67-Q72):

NEW QUESTION # 67

A victim of Internet fraud fell for an online offer after using a search engine to find a deal on an expensive software purchase. Once the victim learned about the fraud, he contacted a forensic investigator for help.

Which digital evidence should the investigator collect?

- A. Virus signatures
- **B. Computer logs**
- C. Email headers
- D. Whois records

Answer: B

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

In Internet fraud investigations, computer logs are critical because they provide a record of user activity, including browsing history, downloads, and system events. These logs can help establish a timeline, identify malicious access, and confirm fraudulent transactions.

* Computer logs may include browser history, system event logs, and application logs that document the victim's interaction with the fraudulent offer.

* Whois records help identify domain registration details but are secondary evidence.

* Email headers are relevant if communication via email was part of the fraud but less critical than logs that show direct interaction.

* Virus signatures are used in malware investigations, not directly relevant to fraud evidence collection.

Reference:According to guidelines by the International Journal of Digital Crime and Forensics and the SANS Institute, capturing logs is essential in building a case for Internet fraud as it provides objective data about the victim's system and activities.

NEW QUESTION # 68

An organization is determined to prevent data leakage through steganography. It has developed a workflow that all outgoing data must pass through. The company will implement a tool as part of the workflow to check for hidden data.

Which tool should be used to check for the existence of steganographically hidden data?

- A. Forensic Toolkit (FTK)
- B. Data Doctor
- C. MP3Stego
- D. Snow

Answer: D

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

Snow is a specialized steganalysis tool that detects and extracts hidden data encoded in whitespace characters within text files and other mediums. It is widely used in digital forensic investigations for detecting covert data hiding methods such as whitespace steganography.

* Data Doctor is a general data recovery tool, not specialized in steganalysis.

* FTK is a general forensic suite, not specifically designed for steganography detection.

* MP3Stego is focused on audio steganography.

NIST and digital forensics literature recognize Snow as a valuable tool in workflows designed to detect hidden data in text or similar carriers.

NEW QUESTION # 69

A forensic investigator needs to identify where email messages are stored on a Microsoft Exchange server.

Which file extension is used by Exchange email servers to store the mailbox database?

- A. .edb
- B. .db
- C. .nsf
- D. .mail

Answer: A

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

Microsoft Exchange Server uses the.edbfile extension for its Extensible Storage Engine (ESE) database files.

These.edbfiles contain the mailbox data including emails, calendar items, and contacts.

* .nsf is used by IBM Lotus Notes.

* .mailand.dbare generic extensions but not standard for Exchange.

* The.edbfile is the primary data store for Exchange mailboxes.

Reference:According to Microsoft technical documentation and forensic manuals, the Exchange mailbox database is stored in.edbfiles, which forensic examiners analyze to recover email evidence.

NEW QUESTION # 70

A forensic investigator suspects that spyware has been installed to a Mac OS X computer by way of an update. Which Mac OS X log or folder stores information about system and software updates?

- A. /Library/Receipts
- B. /var/vm
- C. /var/log/daily.out
- D. /var/spool/cups

Answer: A

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

The/Library/Receipts folder on Mac OS X contains receipts that track software installation and updates, including system and application updates. This folder helps forensic investigators determine which updates were installed and when, useful for detecting suspicious or unauthorized software installations like spyware.

* /var/spool/cups is related to printer spooling.

* /var/log/daily.out contains daily system log summaries but not detailed update records.

* /var/vm contains virtual memory files.

NIST and Apple forensics documentation indicate that/Library/Receipts is a key location for examining software installation history.

NEW QUESTION # 71

- A. Find evidence, analyze evidence, and prosecute evidence
- B. Find evidence, preserve evidence, and prepare evidence
- C. Preserve evidence, encrypt evidence, and delete evidence
- D. Analyze evidence, prepare evidence, and document evidence

Answer: B

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

The fundamental tasks for a forensic specialist are to locate potential digital evidence, ensure its preservation to prevent tampering or loss, and prepare the evidence for analysis or legal proceedings. Proper handling maintains the evidentiary value of digital artifacts.

* Preservation includes using write-blockers and documenting chain of custody.

* Preparation may involve imaging, cataloging, and validating evidence.

Reference: NIST SP 800-86 emphasizes these stages as critical components of forensic processes.
