Many customers may doubt the quality of our Plat-Arch-201 learning quiz since they haven't tried them. But our Plat-Arch-201 training engine is reliable. What you have learnt on our Plat-Arch-201 exam materials are going through special selection. The core knowledge of the real exam is significant. With our guidance, you will be confident to take part in the Plat-Arch-201 Exam. Our Plat-Arch-201 study materials will be your good assistant. Put your ideas into practice.

Salesforce Certified Platform Data Architect Sample Questions (Q24-Q29):

NEW QUESTION # 24

Universal Container (US) is replacing a home-grown CRM solution with Salesforce. UC has decided to migrate operational (Open and active) records to Salesforce, while keeping historical records in legacy system. UC would like historical records to be available in Salesforce on an as needed basis. Which solution should a data architect recommend to meet business requirement?

- A. Bring all data Salesforce, and delete it after a year.
- B. Build a chair solution to go the legacy system and display records.

- C. Leverage real-time integration to pull records into Salesforce.
- **D. Leverage mashup to display historical records in Salesforce.**

Answer: D

Explanation:

According to the Using Mashups article on Salesforce Developers, one of the techniques for deploying large data volumes is to use mashups to display historical records in Salesforce. The article states that "Mashups are a way to display data from an external system within a Salesforce page without copying or synchronizing the data. Mashups use a combination of Visualforce, Apex callouts, and JavaScript code that runs in the browser. Mashups are useful when you want to display large amounts of read-only data that is stored outside of Salesforce." Therefore, a data architect should recommend this solution to meet the business requirement of UC.

NEW QUESTION # 25

A data architect is working with a large B2C retailer and needs to model the consumer account structure in Salesforce. What standard feature should be selected in this scenario?

- A. Account Contact
- B. Individual Accounts
- **C. Person Accounts**
- D. Contacts

Answer: C

Explanation:

According to this article, person accounts are designed to store information about individual people by combining certain account and contact fields into a single record. This is suitable for a large B2C retailer that needs to model the consumer account structure in Salesforce.

NEW QUESTION # 26

Universal Containers (UC) is transitioning from Classic to Lightning Experience. What does UC need to do to ensure users have access to its notices and attachments in Lightning Experience?

- A. Add Notes and Attachments Related List to page Layout in Lightning Experience.
- B. Manually upload Notes in Lightning Experience.
- C. Manually upload Attachments in Lightning Experience.
- **D. Migrate Notes and Attachment to Enhanced Notes and Files a migration tool**

Answer: D

Explanation:

The correct answer is C, migrate Notes and Attachment to Enhanced Notes and Files using a migration tool. Enhanced Notes and Files are the new features in Lightning Experience that replace the classic Notes and Attachments. They offer more functionality and security than the classic version. To access them in Lightning Experience, you need to migrate your existing Notes and Attachments using a migration tool provided by Salesforce. Adding Notes and Attachments Related List, manually uploading Notes or Attachments, or doing nothing are not valid solutions, as they will not enable you to use the enhanced features in Lightning Experience.

NEW QUESTION # 27

A customer is facing locking issues when importing large data volumes of order records that are children in a master-detail relationship with the Account object. What is the recommended way to avoid locking issues during import?

- A. Import Order records and Account records separately and populate AccountID in orders using batch Apex.
- B. Change the relationship to Lookup and update the relationship to master-detail after import.
- **C. Import Account records first followed by order records after sorting orders by AccountID.**
- D. Import Account records first followed by order records after sorting order by OrderID.

Answer: C

Explanation:

Importing Account records first followed by order records after sorting orders by AccountID is the recommended way to avoid locking issues during import. This can reduce the number of lock contention errors by minimizing the number of parent records that are concurrently processed by multiple batches. Sorting orders by AccountID can also group the child records by their parent records and avoid updating the same parent record in different batches. Importing Account records first followed by order records after sorting order by OrderID will not help with avoiding locking issues because it does not group the child records by their parent records. Changing the relationship to Lookup and updating the relationship to master-detail after import will not work because changing a relationship from Lookup to master-detail requires that all child records have a parent record, which may not be the case after import. Importing Order records and Account records separately and populating AccountID in orders using batch Apex will not help with avoiding locking issues because it still requires updating the parent records in batches.

NEW QUESTION # 28

A customer is operating in a highly reputed industry and is planning to implement SF. The customer information maintained in SF, includes the following:

- Personally, identifiable information (PII)
- IP restrictions on profiles organized by Geographic location
- Financial records that need to be private and accessible only by the assigned Sales associate.
- User should not be allowed to export information from Salesforce.

Enterprise security has mandate access to be restricted to users within a specific geography and detail monitoring of user activity. Which 3 Salesforce shield capabilities should a data architect recommend? Choose 3 answer

- A. Restrict access to SF from users outside specific geography
- B. Event monitoring to monitor all user activities
- C. Prevent Sales users access to customer PII information
- D. Encrypt Sensitive Customer information maintained in SF.
- E. Transaction security policies to prevent export of SF Data.

Answer: A,D,E

Explanation:

The best Salesforce Shield capabilities for the customer are to restrict access to SF from users outside specific geography, implement transaction security policies to prevent export of SF data, and encrypt sensitive customer information maintained in SF. Salesforce Shield is a set of security features that help protect enterprise data on the Salesforce platform. It includes three components: Event Monitoring, Platform Encryption, and Field Audit Trail. Restricting access to SF from users outside specific geography can be done using network-based security features, such as IP whitelisting or VPN. Transaction security policies can be used to define actions or notifications based on user behavior patterns, such as exporting data or logging in from an unknown device. Platform Encryption can be used to encrypt data at rest using a tenant secret key that is controlled by the customer.

NEW QUESTION # 29

.....

Do you want to ace the Salesforce Plat-Arch-201 exam in one go? If so, you have come to the right place. You can get the updated Plat-Arch-201 exam questions from TorrentValid, which will help you crack the Plat-Arch-201 test on your first try.
