

Updated Appian ACA-100 Dumps | Reliable ACA-100 Exam Sims

DOWNLOAD the newest ActualtestPDF ACA-100 PDF dumps from Cloud Storage for free: <https://drive.google.com/open?id=1zwSkbHUiUuu0t6qqs5OShXMEutwID9W>

Actually our ACA-100 study materials cover all those traits and they are your prerequisites for successful future. Providing various and efficient ACA-100 exam preparation with reasonable prices and discounts, satisfy your need with considerate after-sales services and we give back all your refund entirely once you fail the ACA-100 test unluckily. All those features roll into one. They can greatly solve your problem-solving abilities.

The Appian Certified Analyst (ACA-100) certification is a valuable credential that every Appian professional should earn it. The Appian ACA-100 certification exam offers a great opportunity for beginners and experienced professionals to demonstrate their expertise. With the Appian Certified Analyst (ACA-100) certification exam everyone can upgrade their skills and knowledge. There are other several benefits that the ACA-100 Exam holders can achieve after the success of the Appian Certified Analyst (ACA-100) certification exam. However, you should keep in mind to pass the Appian ACA-100 certification exam is not an easy task. It is a challenging job.

Splendid ACA-100 Exam Brindumps are from High-quality Learning Quiz - ActualtestPDF

Our website is a pioneer in providing comprehensive Appian dumps torrent because we have a group of dedicated IT experts who have more than 10 years of experience in the study of ACA-100 test questions and answers. They work in advance to make sure that our candidates will get latest and accurate ACA-100 Exam Prep materials. You will get ACA-100 passing score with the shortest duration for exam preparation.

Appian Certified Analyst Sample Questions (Q34-Q39):

NEW QUESTION # 34

What are three of Appian's core capabilities?

- A. Automating business processes with complex workflow
- B. Designing effective user interfaces by combining available UI components
- C. Building highly-interactive reporting or data exploration applications
- D. Connecting to database management systems (e.g., Oracle, MySQL, Microsoft SQL Server)
- E. Accommodating applications that need to run completely offline

Answer: A,B,D

Explanation:

Connecting to Database Management Systems (C): One of Appian's core capabilities is its ability to connect with various database management systems. This allows for seamless data integration, retrieval, and management, enabling applications to interact with databases like Oracle, MySQL, and Microsoft SQL Server, among others. Appian Documentation - Database Connections

Designing Effective User Interfaces by Combining Available UI Components (D): Appian provides a wide range of UI components that can be combined to design effective and user-friendly interfaces. This capability allows developers to create intuitive and interactive applications that meet user requirements. Appian Documentation - User Interface Design Automating Business Processes

with Complex Workflow (E): Appian excels in automating business processes, especially those that involve complex workflows. Its workflow automation capabilities allow for the orchestration of tasks, approvals, and other process activities, making it a powerful tool for process-driven applications. Appian Documentation - Workflow Automation Note: Building highly-interactive reporting or data exploration applications (A) is possible in Appian, but it's not the platform's primary focus. Accommodating applications that need to run completely offline (B) is not one of Appian's core capabilities, as it is primarily designed for online, connected applications.

NEW QUESTION # 35

Which one of the following Appian object combinations allows you to directly access and use data from the Appian database?

- A. An interface object with an integration call
- B. An expression rule with an integration call
- C. An expression rule with a query
- D. A process model that uses an Export to Excel smart service

Answer: C

Explanation:

In Appian, the combination of an expression rule with a query allows you to directly access and use data from the Appian database. Expression rules are used to define business logic, while queries are used to retrieve data from the database.

Expression Rule with a Query:

An expression rule can be used to execute a query against the Appian database to retrieve data.

This combination allows you to filter, sort, and manipulate the data retrieved directly from the database within your application logic.

The `a!queryEntity()` function is commonly used within an expression rule to fetch data from a specific entity in the database.

Why Not Other Options?:

A . An expression rule with an integration call: This option is used for retrieving data from external systems, not directly from the Appian database.

C . A process model that uses an Export to Excel smart service: This is used for exporting data to Excel but does not directly access the database for querying purposes.

D . An interface object with an integration call: This combination is also used for interfacing with external systems rather than directly accessing the Appian database.

Implementation in Appian:

Define an expression rule that uses `a!queryEntity()` to fetch data from a specific table or view in the Appian database.

The query can be customized with filters, sorting, and paging to retrieve the exact data needed for the application.

Appian Documentation on Expression Rules: Expression Rules in Appian

Appian Query Entity Function: `a!queryEntity()` Function

NEW QUESTION # 36

As an Appian Analyst, which two activities are you responsible for during the "Initiate" phase of a project?

- A. Plan a requirement gathering approach
- B. Build the deployment pipeline
- C. Conduct sprint reviews

- **D. Define personas**

Answer: A,D

Explanation:

Define Personas (C): During the "Initiate" phase, one of the key activities is defining personas. This involves identifying and detailing the different types of users who will interact with the application. Understanding these personas helps ensure that the application meets the needs of all user groups and informs the design and functionality of the system. Appian Documentation - User Personas
Plan a Requirement Gathering Approach (D): Planning the requirement gathering approach is another crucial activity in the "Initiate" phase. This step involves determining how requirements will be collected, documented, and validated throughout the project. A well-defined approach ensures that all necessary information is captured early, setting a strong foundation for the development process. Appian Documentation - Requirements Gathering Note: Building the deployment pipeline (A) and conducting sprint reviews (B) are activities typically associated with later phases in the project lifecycle, such as development and delivery.

NEW QUESTION # 37

Which Appian object's primary purpose is to define the structure of related data for use in a process model?

- A. Record
- **B. Custom Data Type (CDT)**
- C. Constant
- D. Expression Rule

Answer: B

Explanation:

A Custom Data Type (CDT) in Appian is primarily used to define the structure of related data. It represents a structured data type composed of multiple fields, and it is often used in process models to define the shape of data that will be passed between different activities or stored in the database.

Custom Data Type (CDT) Overview:

CDTs allow developers to define a complex data structure that can include various data types, such as text, numbers, dates, and even nested CDTs.

They are essential for passing structured data within a process model and between Appian applications and external systems.

Why Not Other Options?:

B . Record: Used to represent a view of data from an external or internal source, focusing on displaying and interacting with that data rather than defining its structure.

C . Constant: Stores a fixed value that can be used throughout the application, but it does not define complex data structures.

D . Expression Rule: Encapsulates logic and calculations but does not define data structures.

References:

Appian Documentation on Custom Data Types: Custom Data Types (CDT)

Using CDTs ensures that the data used within process models is structured and consistent, enabling robust data handling across the application.

NEW QUESTION # 38

A given user story has a description and an acceptance criterion.

Which two other things are needed to mark the story as ready?

- A. Sprint number
- **B. Estimation**
- C. Developer assignment
- **D. Priority**

Answer: B,D

Explanation:

Priority (A): Before a user story can be marked as ready, it needs to be prioritized. This helps the development team understand the importance of the story relative to other items in the backlog and ensures that the most critical features are addressed first. Appian Documentation - Managing Backlogs and Prioritization
Estimation (D): Estimation is essential to determine the effort required to implement the user story. It allows the team to plan the sprint effectively, allocate resources, and ensure that the story can be completed within the sprint timeline. Appian Documentation - Estimation Techniques Note: Sprint number (B) and developer
