Guidewire Associate Certification - InsuranceSuite Analyst - Mammoth Proctored Exam Sample Questions (Q13-Q18):

NEW QUESTION # 13

An example of a tool built by Guidewire Professional Services to support implementation projects is:

- A. Guiding principle
- B. Requirement
- C. User story card
- D. Business objective

Answer: C

Explanation:

The User Story Cards is a key tool developed and standardized by Guidewire Professional Services to support InsuranceSuite implementation projects, making Option A the correct answer.

User story cards provide a structured, consistent way to capture requirements using an Agile approach aligned with SurePath methodology. They define business intent, acceptance criteria, and scope boundaries in a format that supports elaboration, estimation, development, and testing.

The remaining options are not tools. Requirements (Option B), business objectives (Option C), and guiding principles (Option D) are types of content, not standardized delivery tools.

User story cards enable consistent communication across analysts, developers, and testers and are central to successful Guidewire implementations.

NEW QUESTION # 14

When prioritizing the implementation of a new state regulation for flood risk assessment in commercial property policies, which factors are most crucial for ensuring strategic value alignment and a successful Guidewire Cloud deployment?

- A. Prioritizing integration with a third-party flood modeling service that significantly deviates from Guidewire OOTB capabilities
- B. Analyzing how the new assessment process aligns with the company's long-term objective of reducing overall loss exposure and improving underwriting excellence

- C. Implementing only the minimum data capture quickly and postponing proper data modeling
- D. Focusing solely on the legal interpretation of the regulation, even if it requires complex custom development
- E. Ensuring the new solution adheres to Guidewire Cloud Standards to enable seamless future updates and optimal platform performance
- F. Maximizing reuse of legacy system code and UI elements regardless of Guidewire Cloud Standards

Answer: B,E

Explanation:

In Guidewire Cloud implementations, prioritization decisions must balance regulatory compliance, business value, and long-term platform sustainability. The most crucial factors are strategic business alignment and adherence to Guidewire Cloud Standards, making Options A and C correct.

Analyzing how the regulation aligns with long-term underwriting and risk management objectives (Option A) ensures the solution delivers more than compliance. This approach supports value-driven requirements by improving underwriting quality and reducing loss exposure, rather than treating regulation as a standalone obligation.

Ensuring adherence to Guidewire Cloud Standards (Option C) is equally critical. These standards protect upgradeability, performance, and operational stability. Solutions that follow Cloud Standards are easier to maintain and less likely to cause issues during future platform upgrades.

The remaining options represent short-term or high-risk approaches. Over-customization (Option B), deviation from OOTB functionality (Option D), deferring proper data modeling (Option E), and reusing legacy patterns (Option F) all increase technical debt and threaten cloud success.

NEW QUESTION # 15

Which of the following describes what are User Story acceptance criteria?

Choose 2 options.

- A. They describe the role, the expected action, and the reason why the action is needed
- B. They describe the value delivered to end-user
- C. They are a checklist of key activities that must be completed in order to accept a story
- D. They tell when a user story is 'done'

Answer: C,D

Explanation:

The correct answers are A and D because acceptance criteria define the conditions that must be satisfied for a user story to be considered complete and acceptable. In Guidewire-style requirements work, user stories capture a business need at a high level, while acceptance criteria add the specific expectations that clarify how the team and stakeholders will know the story has been successfully delivered.

A). They are a checklist of key activities that must be completed in order to accept a story is correct because acceptance criteria function as a practical set of conditions or checkpoints. They guide development, testing, and business validation by making the expected results explicit. Although not always written as task steps, they serve as a measurable list of what must be true before the story is accepted.

D). They tell when a user story is 'done' is also correct because that is one of the main purposes of acceptance criteria. They define the boundaries of completion and help avoid ambiguity about whether the delivered functionality meets the intended requirement. This supports better collaboration among analysts, developers, testers, and business stakeholders.

B is incorrect because describing the value delivered to the end-user is part of the user story itself, not the acceptance criteria. C is also incorrect because describing the role, action, and reason follows the common user story format such as "As a [role], I want [action], so that [benefit]." That structure defines the story statement, while acceptance criteria define the testable conditions for acceptance.

So, acceptance criteria are best understood as the conditions/checklist used to determine when a story is complete and acceptable .

NEW QUESTION # 16

Story huddles are used to clarify functional requirement details and typically involve collaboration among which three required project team members?

- A. Product Owners
- B. Developers
- C. Business Analysts
- D. Quality Analysts

- E. Subject Matter Experts

Answer: B,C,D

Explanation:

Story Huddles, also frequently referred to as "Three Amigos" sessions or "Triad" meetings in Guidewire's Agile methodology, are critical synchronization points used to clarify functional requirements before development work typically begins or finalized. The three core participants required for these huddles are:

* Business Analysts (D): They represent the business intent and provide the detailed functional requirements. Their role is to explain what needs to be built, answering questions about logic, UI behavior, and business rules.

* Developers (B): They provide the technical perspective. They ask questions to determine how the feature will be implemented, identifying technical constraints, necessary data model changes, or architectural dependencies.

* Quality Analysts (C): They represent the testing perspective. They focus on how the feature will be validated, ensuring acceptance criteria are testable, covering edge cases, and that there is a shared understanding of "done." Purpose of the Huddle:

The primary goal of the story huddle is to ensure a shared understanding of the user story among these three distinct disciplines. It prevents the common "silo" problem where developers misinterpret requirements or QA tests for the wrong behavior. By collaborating before coding starts (or early in the sprint), the team reduces defects and rework.

Why other options are less appropriate:

* Product Owners (A): While Product Owners define the vision and priority, they often delegate the detailed "story level" clarification to Business Analysts in large implementation projects. The "Three Amigos" strictly refers to the execution trio (BA, Dev, QA).

* Subject Matter Experts (E): SMEs provide input to the BA during requirements gathering (Elaboration) but are not typically required attendees for the technical story huddle, which is focused on implementation readiness.

NEW QUESTION # 17

Which statement best describes why the Guiding Principles are important to the requirements-gathering process?

- A. They help the project team objectively determine which requirements are aiding in project success.
- B. They indicate who should make prioritization choices.
- C. They provide all the necessary project details to ensure that requirements gathering defines a solution.
- D. They ensure that the key stakeholders have been involved in the requirements-gathering process.

Answer: A

Explanation:

Guiding Principles are foundational statements established early in a Guidewire project to support objective, value-driven decision-making throughout requirements gathering and delivery. The correct answer is Option A.

Guiding Principles help the project team evaluate requirements consistently by providing a shared lens for determining whether a requirement contributes to project success. For example, principles such as "configure before customize" or "prioritize regulatory compliance" help analysts and stakeholders assess whether a proposed requirement aligns with strategic goals.

They do not assign prioritization authority (Option B), replace detailed requirements (Option C), or guarantee stakeholder participation (Option D). Instead, they act as decision filters, especially when trade-offs arise during elaboration or scope discussions. By using Guiding Principles, analysts can challenge low-value or legacy-driven requests and steer conversations toward solutions that align with Guidewire best practices and long-term business value.
