## CompTIA Security+ Certification Exam Sample Questions (Q725-Q730):

### NEW QUESTION # 725

A program manager wants to ensure contract employees can only use the company's computers Monday through Friday from 9 a.m. to 5 p.m. Which of the following would best enforce this access control?

- A. Implementing SAML with federation to the contract employees' authentication server
- B. Implementing an OAuth server and then setting least privilege for contract employees
- C. Creating a discretionary access policy and setting rule-based access for contract employees
- D. Creating a GPO for all contract employees and setting time-of-day log-in restrictions

**Answer: D**

Explanation:

The most appropriate method is to use a Group Policy Object (GPO) with time-of-day restrictions (A).

This is a native capability in Windows environments that allows administrators to control when users are allowed to log into domain-joined systems.

This aligns with Domain 3.1: Given a scenario, apply identity and access management (IAM) concepts, especially under "Access controls (e.g., time-based restrictions, GPOs, least privilege)."

### NEW QUESTION # 726

Visitors to a secured facility are required to check in with a photo ID and enter the facility through an access control vestibule. Which of the following best describes this form of security control?

- A. Technical
- B. Physical

- C. Operational
- D. Managerial

**Answer: B**

Explanation:

A physical security control is a device or mechanism that prevents unauthorized access to a physical location or asset. An access control vestibule, also known as a mantrap, is a physical security control that consists of a small space with two sets of interlocking doors, such that the first set of doors must close before the second set opens. This prevents unauthorized individuals from following authorized individuals into the facility, a practice known as piggybacking or tailgating. A photo ID check is another form of physical security control that verifies the identity of visitors. Managerial, technical, and operational security controls are not directly related to physical access, but rather to policies, procedures, systems, and processes that support security objectives. #### NEW QUESTION # 727

Which of the following is most likely associated with introducing vulnerabilities on a corporate network by the deployment of unapproved software?

- A. Script kiddies
- B. Competitors
- C. Hacktivists
- **D. Shadow IT**

**Answer: D**

Explanation:

Shadow IT refers to information technology systems used within organizations without explicit organizational approval.

#### NEW QUESTION # 728

A vendor needs to remotely and securely transfer files from one server to another using the command line. Which of the following protocols should be implemented to allow for this type of access? (Select two).

- **A. SSH**
- B. SMTP
- C. RDP
- D. SNMP
- **E. SFTP**
- F. S/MIME

**Answer: A,E**

Explanation:

Secure Shell (SSH) is a protocol used for secure command-line access to remote systems, while Secure File Transfer Protocol (SFTP) is an extension of SSH used specifically for securely transferring files. Both SSH and SFTP ensure that data is encrypted during transmission, protecting it from interception or tampering.

#### NEW QUESTION # 729

A company's end users are reporting that they are unable to reach external websites. After reviewing the performance data for the DNS servers, the analyst discovers that the CPU, disk, and memory usage are minimal, but the network interface is flooded with inbound traffic. Network logs show only a small number of DNS queries sent to this server. Which of the following best describes what the security analyst is seeing?

- A. Concurrent session usage
- **B. Reflected denial of service**
- C. Secure DNS cryptographic downgrade

- D. On-path resource consumption

**Answer: B**

Explanation:

A reflected denial of service (RDoS) attack is a type of DDoS attack that uses spoofed source IP addresses to send requests to a third-party server, which then sends responses to the victim server. The attacker exploits the difference in size between the request and the response, which can amplify the amount of traffic sent to the victim server. The attacker also hides their identity by using the victim's IP address as the source. A RDoS attack can target DNS servers by sending forged DNS queries that generate large DNS responses. This can flood the network interface of the DNS server and prevent it from serving legitimate requests from end users.
