Learning is just a part of our life. We do not hope that you spend all your time on learning the 312-50v13 certification materials. Life needs balance, and productivity gives us a sense of accomplishment and value. So our 312-50v13 real exam dumps have simplified your study and alleviated your pressure from study. It is our goal that you study for a short time but can study efficiently. At present, thousands of candidates have successfully passed the 312-50v13 Exam with less time input. In fact, there is no point in wasting much time on invalid input. As old saying goes, all work and no play makes jack a dull boy. Our 312-50v13 certification materials really deserve your choice. Contact us quickly. We are waiting for you.

PrepAwayTest releases a new high pass-rate 312-50v13 valid exam preparation recently. If you are still puzzled by your test you can set your heart at rest to purchase our valid exam materials which will assist you to clear exam easily. We can guarantee purchasing ECCouncil 312-50v13 Valid Exam Preparation will be the best passing methods and it always help you pass exam at first attempt. Now it is really an opportunity. Stop waiting and hesitate again!

What is more, some after-sales services behave indifferently towards exam candidates who eager to get success, our 312-50v13 practice materials are on the opposite of it. So just set out undeterred with our 312-50v13 practice materials, These 312-50v13 practice materials win honor for our company, and we treat it as our utmost privilege to help you achieve your goal. Our 312-50v13 practice materials are made by our responsible company which means you can gain many other benefits as well.

ECCouncil Certified Ethical Hacker Exam (CEHv13) Sample Questions (Q761-Q766):

NEW QUESTION # 761
During a reconnaissance mission, an ethical hacker uses Maltego, a popular footprinting tool, to collect information about a target organization. The information includes the target's Internet infrastructure details (domains, DNS names, Netblocks, IP address information). The hacker decides to use social engineering techniques to gain further information. Which of the following would be the least likely method of social engineering to yield beneficial information based on the data collected?

- A. Impersonating an ISP technical support agent to trick the target into providing further network details
- B. Shoulder surfing to observe sensitive credentials input on the target's computers
- C. Eavesdropping on internal corporate conversations to understand key topics
- D. Dumpster diving in the target company's trash bins for valuable printouts

Answer: B

Explanation:
Shoulder surfing is a social engineering technique that involves looking over someone's shoulder to observe sensitive information, such as passwords, PINs, or credit card numbers, that they enter on their computer, phone, or ATM. It is the least likely method of social engineering to yield beneficial information based on the data collected by Maltego, because it requires physical proximity and access to the target's devices, which may not be feasible or safe for the hacker. Moreover, shoulder surfing does not leverage the information obtained by Maltego, such as domains, DNS names, Netblocks, or IP addresses, which are more relevant for network-based attacks.
The other options are more likely to yield beneficial information based on the data collected by Maltego, because they involve exploiting the target's trust, curiosity, or negligence, and using the information obtained by Maltego to craft convincing scenarios or messages. Impersonating an ISP technical support agent to trick the target into providing further network details is a form of pretexting, where the hacker creates a false identity and scenario to obtain information or access from the target. Dumpster diving in the target company's trash bins for valuable printouts is a technique that relies on the target's negligence or lack of proper disposal of sensitive documents, such as network diagrams, passwords, or confidential reports. Eavesdropping on internal corporate conversations to understand key topics is a technique that exploits the target's curiosity or lack of awareness, and allows the hacker to gather information about the target's projects, plans, or problems, which can be used for further attacks or extortion. NEW QUESTION # 762
The Payment Card Industry Data Security Standard (PCI DSS) contains six different categories of control objectives. Each objective contains one or more requirements, which must be followed in order to achieve compliance. Which of the following requirements would best fit under the objective, "Implement strong access control measures"?

- A. Encrypt transmission of cardholder data across open, public networks.
- B. Regularly test security systems and processes.
- C. Use and regularly update anti-virus software on all systems commonly affected by malware.
- D. Assign a unique ID to each person with computer access.

Answer: D

NEW QUESTION # 763
Bob wants to ensure that Alice can check whether his message has been tampered with. He creates a checksum of the message and encrypts it using asymmetric cryptography. What key does Bob use to encrypt the checksum for accomplishing this goal?

- A. Alice's public key
- B. His own public key
- C. Alice's private key
- D. His own private key

Answer: A

NEW QUESTION # 764
To determine if a software program properly handles a wide range of invalid input, a form of automated testing can be used to randomly generate invalid input in an attempt to crash the program.
What term is commonly used when referring to this type of testing?

- A. Bounding
- B. Fuzzing
- C. Mutating
- D. Randomizing

Answer: B

Explanation:
This form of testing is known as Fuzzing. Fuzzing (or fuzz testing) is an automated software testing technique that involves providing

invalid, unexpected, or random data as inputs to a computer program. The program is then monitored for exceptions such as crashes, failing built-in code assertions, or potential memory leaks.
In the CEH v13 courseware and study guide:
Module 6: Malware Threats
Subsection: Malware Analysis and Reverse Engineering Techniques
CEH v13 Official Study Guide and iLabs Practical
The CEH v13 guide states:
"Fuzzing is used as a software testing technique that involves sending malformed or unexpected inputs to an application in order to detect vulnerabilities such as buffer overflows, crashes, or unexpected behavior. It is particularly useful during vulnerability assessments and exploit development." Thus, Fuzzing helps identify vulnerabilities due to improper input validation and is widely used in vulnerability discovery and exploit testing.
Incorrect Options:
A). Randomizing: Not a recognized security testing method.
B). Bounding: Refers to setting limits or constraints; not relevant here.
C). Mutating: Can be part of fuzzing (mutation-based fuzzing), but not the umbrella term.

NEW QUESTION # 765
This wireless security protocol allows 192-bit minimum-strength security protocols and cryptographic tools to protect sensitive data, such as GCMP-2S6. MMAC-SHA384, and ECDSA using a 384-bit elliptic curve.
Which is this wireless security protocol?

- A. WPA2 Personal
- B. WPA2-Enterprise
- C. WPA3-Enterprise
- D. WPA3-Personal

Answer: C

Explanation:
Enterprise, governments, and financial institutions have greater security with WPA3-Enterprise. WPA3- Enterprise builds upon WPA2 and ensures the consistent application of security protocol across the network.
WPA3-Enterprise also offers an optional mode using 192-bit minimum-strength security protocols and cryptographic tools to raised protect sensitive data:
* Authenticated encryption: 256-bit Galois/Counter Mode Protocol (GCMP-256)
* Key derivation and confirmation: 384-bit Hashed Message Authentication Mode (HMAC) with Secure Hash Algorithm (HMAC-SHA384)
* Key establishment and authentication: Elliptic Curve Diffie-Hellman (ECDH) exchange and Elliptic Curve Digital Signature Algorithm (ECDSA) employing a 384-bit elliptic curve
* Robust management frame protection: 256-bit Broadcast/Multicast Integrity Protocol Galois Message Authentication Code (BIP-GMAC-256) The 192-bit security mode offered by WPA3-Enterprise ensures the proper combination of cryptographic tools are used and sets a uniform baseline of security within a WPA3 network.
It protects sensitive data using many cryptographic algorithms It provides authenticated encryption using GCMP-256 It uses HMAC-SHA-384 to generate cryptographic keys It uses ECDSA-384 for exchanging keys
