## 2026 ADX-350: Authoritative Salesforce Certified Hyperautomation Specialist Exam Braindump Free

We stipulate the quality and accuracy of ADX-350 exam questions every year for your prospective dream. And our experts team keep close eyes on the upfront message that can help you deal with the new question points emerging during your simulation exercise of ADX-350 practice materials. So instead of being seduced by the prospect of financial reward solely, we consider more to the interest and favor of our customers. By our customers' high praise, we will do better on our ADX-350 exam braindumps!

## Salesforce Certified Hyperautomation Specialist Exam Sample Questions (Q52-Q57):

### NEW QUESTION # 52

Northern Trail Outfitters (NTO) has a complicated process that involves several departments. How should stages be used in Flow Orchestration to organize this process?

- A. Assigning individual steps to specific users or groups that interact with the process.
- **B. Grouping steps of the process based on hand-offs or key branches of the process.**
- C. Grouping steps based on the systems and tools that will be used to implement the process.
- D. Organizing individual steps to be run in parallel to one another throughout the process.

**Answer: B**

Explanation:

In Flow Orchestration, stages should be used to organize a complicated process by grouping steps based on hand-offs or key branches of the process:

Stages in Flow Orchestration:

Stages help structure the overall process by grouping related steps. Each stage can represent a major phase in the process, which might involve a transition of responsibility or a significant decision point.

Grouping by Hand-offs:

Organizing steps by hand-offs ensures that when responsibility shifts from one department to another, the transition is clear and manageable. This approach aligns with the natural flow of work across departments.

Key Branches:

Key branches in the process often represent decision points or significant changes in the workflow. Grouping steps that belong to these branches within specific stages helps in managing and tracking progress more effectively.

### NEW QUESTION # 53

AnyAirlines has a MuleSoft Composer flow between NetSuite and Salesforce. One of the data elements coming from NetSuite is a string that needs to be put into a Boolean field in a Salesforce object.

Which Composer function should be used to change the datatype of the value?

- A. `fromStringToBoolean()`
- B. `fromBooleanToString()`
- C. `substitute()`
- D. `today()`

**Answer: A**

Explanation:

To convert a string from NetSuite into a Boolean field in a Salesforce object within MuleSoft Composer, you should use the `fromStringToBoolean()` function:

Function Purpose:

The `fromStringToBoolean()` function is specifically designed to convert string values to Boolean values. It interprets common Boolean strings like "true", "false", "yes", "no" and converts them into their corresponding Boolean values.

Usage:

Within MuleSoft Composer, use this function in a transformation step to ensure the data coming from NetSuite (as a string) is correctly transformed into a Boolean value before it is mapped to the Salesforce object.

Example:

If the string value from NetSuite is "true", `fromStringToBoolean("true")` will convert this to true in the Boolean field in Salesforce.

### NEW QUESTION # 54

An RPA developer is building the implementation of an RPA process based on the BPMN created by a colleague. In the BPMN, they see the symbol below:

What does the symbol represent?

- A. A point in the process where different activities are performed under different circumstances
- B. A cleanup activity that is performed at the end of the process to ensure all running applications are closed
- C. One possible endpoint for the process
- D. An activity that is performed if an error occurs during processing

**Answer: A**

Explanation:

\* Symbol Meaning: The symbol shown is a diamond with an "X" inside, which represents an exclusive gateway in BPMN (Business Process Model and Notation). This gateway is used to control the flow of the process based on certain conditions or circumstances.

\* Exclusive Gateway: An exclusive gateway routes the process flow into one of several paths based on conditions defined within the process model. Only one path is taken out of the gateway.

\* Usage in Process: When an exclusive gateway is encountered, the process evaluates the conditions on each outgoing sequence flow and chooses the path that meets the conditions. This ensures different activities are performed based on different circumstances.

### NEW QUESTION # 55

The MuleSoft team at Northern Trail Outfitters wants to create a project skeleton that developers can use as a starting point when creating API implementations with Anypoint Studio. This will help drive consistent use of best practices within the team. Which type of Anypoint Exchange artifact should be added to Exchange to publish the project skeleton?

- A. RAML trail definitions to be reused across API implementations
- **B. A MuleSoft application template with key components**
- C. An example of an API implementation following best practices
- D. A custom asset with the default API implementation

**Answer: B**

Explanation:

To create a project skeleton that developers can use as a starting point for API implementations with Anypoint Studio, the best approach is to use a MuleSoft application template:

MuleSoft Application Template:

A MuleSoft application template includes key components and configurations that follow best practices. It provides a consistent starting point for new projects, ensuring that all developers adhere to the same standards.

Benefits:

Using a template helps enforce best practices, reduces the setup time for new projects, and ensures consistency across different implementations.

Publishing to Anypoint Exchange:

Once the template is created, it can be published to Anypoint Exchange where it is accessible to the entire development team. Developers can then use this template to kickstart their API projects, ensuring a uniform approach across the organization.

Anypoint Exchange Templates Documentation

#### NEW QUESTION # 56

What is the difference between Run and Debug modes in Flow Builder?

- A. Run mode is only available for active flows.
- B. Debug mode uses AI to fix any bugs in the flow.
- **C. Debug mode displays details for debugging the flow.**
- D. Run mode uses the latest version of the flow.

**Answer: C**

Explanation:

In Flow Builder, Run and Debug modes have distinct functionalities:

Run Mode:

Executes the flow as it is, allowing you to see the end-to-end execution based on the latest saved version.

Typically used to verify that the flow works as expected under normal conditions.

Debug Mode:

Provides detailed information for each step of the flow, including input and output data, and any errors encountered.

Useful for troubleshooting and identifying issues within the flow, allowing developers to understand how the flow executes and where problems may arise.

Debug mode is specifically designed to aid in diagnosing and fixing issues by providing a granular view of the flow's execution.
