## The ISTQB ISTQB-CTFL Web-Based Practice Exam

The ISTQB ISTQB-CTFL certification exam is one of the top rated career advancement certification exams in the market. This

ISTQB Certified Tester Foundation Level (CTFL v4.0) (ISTQB-CTFL) exam is designed to prove candidates' skills and knowledge levels. By doing this the ISTQB ISTQB-CTFL certificate holders can gain multiple personal and professional benefits. These benefits assist the ISTQB-CTFL Exam holder to pursue a rewarding career in the highly competitive market and achieve their career objectives in a short time period.

## ISTQB Certified Tester Foundation Level (CTFL v4.0) Sample Questions (Q55-Q60):

### NEW QUESTION # 55

Which of the following lists factors That contribute to PROJECT risks?

- A. problems in defining the right requirements; contractual issues; poor software quality characteristics.
- B. poor software quality characteristics; software does not perform its intended functions.
- C. skill and staff shortages; problems in defining the right requirements, contractual issues.
- D. skill and staff shortages; software does not perform its intended functions; problems in defining the right requirements.

**Answer: C**

### NEW QUESTION # 56

Which test approach will best fit a new project, with little documentation and high probability for bugs?

- A. Exploratory testing
- B. Requirements based testing
- C. Metric based approach
- D. Regression testing

**Answer: A**

Explanation:

Exploratory testing is an approach to testing that emphasizes learning, test design and test execution at the same time. Exploratory testing relies on the tester's skills, creativity and intuition to explore the software under test and discover defects. Exploratory testing is suitable for a new project with little documentation and high probability for bugs, as it can help uncover unknown requirements, assumptions and risks. Exploratory testing is not requirements based testing, which is an approach to testing that derives test cases from documented requirements or specifications. Requirements based testing is not feasible for a new project with little documentation, as it requires clear and complete requirements to be available. Exploratory testing is not metric based approach, which is an approach to testing that uses quantitative measures to monitor and control the testing process and evaluate the quality of the software product. Metric based approach is not effective for a new project with high probability for bugs, as it may not capture all aspects of quality and may lead to false confidence or unrealistic expectations. Exploratory testing is not regression testing, which is an approach to testing that verifies that previously tested software still performs correctly after changes. Regression testing is not relevant for a new project with no previous versions or baselines. Verified References: [A Study Guide to the ISTQB® Foundation Level 2018 Syllabus - Springer], Chapter 5, page 47-48.

### NEW QUESTION # 57

Which of the following statements BEST describes the shift-left approach in software testing?

- A. Testing is performed on the entire system or product.
- B. Testing is performed as early as possible in the software development life cycle.
- C. Testing is performed by an independent testing team.
- D. Testing is performed after the development phase is completed.

**Answer: B**

### NEW QUESTION # 58

Which of the following statements about decision tables are TRUE?

- I Generally, decision tables are generated for low risk test items.
- II Test cases derived from decision tables can be used for component tests.
- III Several test cases can be selected for each column of the decision table.

IV The conditions in the decision table represent negative tests generally.

- A. Generally, decision tables are generated for low risk test items. Decision tables are not related to risk level, but rather to complexity level. Decision tables are generated for test items that have complex logic or multiple conditions and actions that need to be tested.
- **B. II. III**
- C. II. IV
- D. I. III
- E. I. IV

**Answer: B**

Explanation:

IV. The conditions in the decision table represent negative tests generally. The conditions in the decision table represent both positive and negative tests, depending on whether they are valid or invalid inputs for the test item. Verified Reference: A Study Guide to the ISTQB Foundation Level 2018 Syllabus - Springer, Chapter 4, page 42-43.

Explanation:

A decision table is a technique that shows combinations of inputs and/or stimuli (causes) with their associated outputs and/or actions (effects). A decision table consists of four quadrants: conditions (inputs), actions (outputs), condition entries (values) and action entries (results). The following statements about decision tables are true:

II. Test cases derived from decision tables can be used for component tests. Decision tables can be used to test components that have multiple inputs and outputs that depend on logical combinations of conditions. Decision tables can help cover all possible combinations or scenarios in a systematic way.

III. Several test cases can be selected for each column of the decision table. A column of a decision table represents a unique combination of condition entries and action entries. Several test cases can be selected for each column by varying other input values or expected results that are not part of the decision table. The following statements about decision tables are false:

#### NEW QUESTION # 59

Which of the following statements about decision tables are TRUE?

- I. Generally, decision tables are generated for low risk test items.
- II. Test cases derived from decision tables can be used for component tests.
- III. Several test cases can be selected for each column of the decision table.
- IV. The conditions in the decision table represent negative tests generally.

- **A. II. III**
- B. II. IV
- C. I. III
- D. I. IV

**Answer: A**

Explanation:

A decision table is a technique that shows combinations of inputs and/or stimuli (causes) with their associated outputs and/or actions (effects). A decision table consists of four quadrants: conditions (inputs), actions (outputs), condition entries (values) and action entries (results). The following statements about decision tables are true:

\* II. Test cases derived from decision tables can be used for component tests. Decision tables can be used to test components that have multiple inputs and outputs that depend on logical combinations of conditions. Decision tables can help cover all possible combinations or scenarios in a systematic way.

\* III. Several test cases can be selected for each column of the decision table. A column of a decision table represents a unique combination of condition entries and action entries. Several test cases can be selected for each column by varying other input values or expected results that are not part of the decision table. The following statements about decision tables are false:

\* I. Generally, decision tables are generated for low risk test items. Decision tables are not related to risk level, but rather to complexity level. Decision tables are generated for test items that have complex logic or multiple conditions and actions that need to be tested.

\* IV. The conditions in the decision table represent negative tests generally.
