## Best Salesforce CRT-450 Dumps [2026] With Real Exam Questions

We value every customer who purchases our CRT-450 test material and we hope to continue our cooperation with you. Our CRT-450 test questions are constantly being updated and improved so that you can get the information you need and get a better experience. Our CRT-450 test questions have been following the pace of digitalization, constantly refurbishing, and adding new things. I hope you can feel the CRT-450 Exam Prep sincerely serve customers. And the pass rate of our CRT-450 training guide is high as 99% to 100%, you will be able to pass the CRT-450 exam with high scores.

Salesforce CRT-450 exam is a prerequisite for advanced certifications such as the Salesforce Certified Platform Developer II and the Salesforce Certified Technical Architect. Salesforce Certified Platform Developer I certification is also a requirement for certain job roles, including Salesforce Developer and Salesforce Administrator. With the increasing demand for Salesforce professionals, obtaining the CRT-450 certification can significantly enhance an individual's career prospects and earning potential.

Salesforce CRT-450 Certification Exam is designed for developers who want to validate their skills and knowledge in designing and developing custom applications on the Salesforce platform. CRT-450 exam measures a candidate's ability to use Apex and Visualforce to build applications, as well as their understanding of the Salesforce platform architecture, data modeling, and security. Obtaining this certification can enhance a developer's career opportunities and demonstrate their expertise in the field.

## Salesforce Certified Platform Developer I Sample Questions (Q91-Q96):

### NEW QUESTION # 91

A developer created these three Rollup Summary fields in the custom object, Project\_ct,

The developer is asked to create a new field that shows the ratio between rejected and approved timesheets for a given project. Which should the developer use to Implement the business requirement in order to minimize maintenance overhead?

- A. Formula field
- B. Apex Trigger
- C. Process Builder
- D. Record-triggered Flow

**Answer: A**

Explanation:

In this scenario, a formula field is the most appropriate choice to calculate the ratio between rejected and approved timesheets for a given project. This is because formula fields automatically calculate their values based on other fields' values, requiring no additional maintenance or manual intervention. They are used for read-only purposes and are visible to users if they have read access to the object containing the formula field.

To create the formula field, the developer can use the following expression:

`IF(Total_Approved_Timesheets__c > 0, Total_Rejected_Timesheet__c / Total_Approved_Timesheets__c, 0)` This expression checks if the total approved timesheets is greater than zero, and if so, divides the total rejected timesheets by the total approved timesheets. Otherwise, it returns zero. This formula field will display the ratio as a decimal number, which can be formatted as a percentage if desired.

References: The use of formula fields for automatic calculations can be referenced in the Salesforce Platform Developer I learning documents, specifically in modules that cover objects and fields management, such as:

- \* Create Object Relationships
- \* Data Modeling
- \* Formula Operators and Functions by Context

## NEW QUESTION # 92

A developer needs to have records with specific field values in order to test a new Apex class.

What should the developer do to ensure the data is available to the test?

- A. Use SOQL to query the org for the required data.
- B. Use `Test.loadData` and reference a CSV file in a static resource.
- C. Use `Test.loadData` and reference a JSON file in Documents.
- D. Use Anonymous Apex to create the required data.

**Answer: B**

Explanation:

The `Test.loadData` method inserts test records from the specified static resource .csv file and for the specified sObject type, and returns a list of the inserted sObjects1. The file contains field names and values for the test records. The first line of the file must contain the field names and subsequent lines are the field values. To learn more about static resources, see "Defining Static Resources" in the Salesforce online help2.

This method is useful for creating test data with specific field values without writing code. The other options are either incorrect or less efficient for this purpose. Anonymous Apex is a way to execute Apex code on demand in the Developer Console, but it is not a recommended way to create test data, as it is not part of the test class and may affect the org data3. SOQL is a query language that can retrieve data from the org, but it cannot create new data. Also, using SOQL to access existing data in a test class requires the `@IsTest (SeeAllData=true)` annotation, which is not a best practice, as it may cause test failures or unpredictable results4.

`Test.loadData` does not support JSON files, only CSV files1. References:

- \* Test Class | Apex Reference Guide | Salesforce Developers
- \* Defining Static Resources | Salesforce Help
- \* Anonymous Apex | Apex Developer Guide | Salesforce Developers
- \* Isolation of Test Data from Organization Data in Unit Tests | Apex Developer Guide | Salesforce Developers

## NEW QUESTION # 93

Which two queries can a developer use in a visualforce controller to protect against SOQL injection Vulnerabilities? Choose 2 answers

- A. `String qryString = 'SELECT Id FROM Contact WHERE Name LIKE :qryName'; List queryResults = Database.query(qryString);`
- B. `String qryName = '%' + name %'; String qryString = 'SELECT Id FROM Contact WHERE Name LIKE :qryName'; List queryResults = Database.query(qryString);`
- C. `String qryName = '%' + String.enforceSecurityChecks(name) + %'; String qryString = 'SELECT Id FROM Contact`

WHERE Name LIKE :qryName'; List queryResults = Database.query(qryString);

- D. String qryName = '%' + String.escapeSingleQuotes(name) + '%'; String qryString = 'SELECT Id FROM Contact WHERE Name LIKE :qryName'; List queryResults = Database.query(qryString);

Answer: A,C

#### NEW QUESTION # 94

A developer has the following requirements:

- \* Calculate the total amount on an Order.
- \* Calculate the line amount for each Line Item based on quantity selected and price.
- \* Move Line Items to a different Order if a Line Item is not in stock.

Which relationship implementation supports these requirements on its own?

- A. Line Item has a re-parentable master-detail field to Order.
- B. Order has a re-parentable master-detail field to Line Item.
- C. Order has a re-parentable lookup field to Line Item.
- D. Line Item has a re-parentable lookup field to Order.

Answer: A

#### NEW QUESTION # 95

Refer to the following Apex code:

What is the value of x when it is written to the debug log?

- A. 0
- B. 1
- C. 2
- D. 3

Answer: C

Explanation:

The given Apex code snippet initializes an integer variable x with a value of 0. It then enters a do-while loop where x is set to 1 and then incremented by one before the loop condition is checked. Since the loop only iterates once (as x is now greater than 1), the final value of x when written to the debug log will be

1. References: The explanation can be inferred from understanding the basic working of loops and variables in Apex, as covered in Salesforce Platform Developer I Learning documents. You can also refer to the Apex Developer Guide for more details on Apex syntax and features.
