CCRN-Pediatric Test Guide - CCRN-Pediatric Actual Exam & CCRN-Pediatric Pass-Sure Torrent

As is known to us, different people different understanding of learning, and also use different methods in different periods, and different learning activities suit different people, at different times of the day. Our CCRN-Pediatric test questions are carefully designed by a lot of experts and professors in order to meet the needs of all customers. We can promise that our CCRN-Pediatric Exam Question will be suitable for all people, including student, housewife, and worker and so on. No matter who you are, you must find that our CCRN-Pediatric guide torrent will help you pass the CCRN-Pediatric exam easily.

AACN Critical Care Nursing Exam Sample Questions (Q132-Q137):

NEW QUESTION # 132

A 15-year-old girl was recently diagnosed of idiopathic scoliosis. She is worried about being different from her friends and upset about the treatment regimen. How would the nurse help her to develop a positive self-image:

- A. assist her in selecting clothes to improve her appearance
- B. refer her to a psychiatrist for consult.
- C. remind her that her back would be crooked if she doesn't adhere to the treatment
- D. be focus on her positive rather her negative attributes

Answer: A

Explanation:

Explanation: The nurse would help her by selecting appropriate clothing that will help minimize the appearance of a brace, especially if an effort is made to wear the current style.

NEW QUESTION # 133

Nurse Tammy is administering total parenteral nutrition (TPN) through a peripheral I.V. line to a school- age child. What's the smallest amount of glucose that's considered safe and not caustic to small veins, while also providing adequate TPN?

- A. 13%
- B. 10%
- C. 15%
- D. 20%

Answer: B

Explanation:

Explanation: The amount of glucose that's considered safe for peripheral veins while still providing adequate total parenteral nutrition is 10%. Any amount above 10% must be administered via central venous access.

NEW QUESTION # 134

A patient is postoperative day 1 from a laparotomy for appendicitis. Which intervention best prevents surgical wound infection?

- A. Encourage nutritional support as early as possible, bathe daily with pH-balanced cleanser, and encourage mobility
- B. Shower twice daily, apply betadine to the skin around the wound, and maintain NPO status
- C. Apply a dressing with plastic tape over the wound, encourage handwashing, and offer a high-calorie diet
- D. Cleanse the wound with antibacterial soap and water, maintain NPO status, and encourage mobility

Answer: A

Explanation:

Early nutritional support, mobilization, and maintaining skin integrity with gentle cleansing are proven strategies to prevent surgical site

infections (SSIs). Nutrients support wound healing, while early mobility reduces the risk of complications like pneumonia and impaired circulation.

"Postoperative infection prevention includes early enteral feeding, routine hygiene with non-irritating agents, and ambulation. These reduce bacterial overgrowth, maintain perfusion, and support immune function." (Referenced from CCRN Pediatric - Direct Care: Integumentary, Postoperative Infection Prevention)

NEW QUESTION # 135

While ventilating with 100% FiO₂ via Ambu bag, an intubated child desaturates. Breath sounds are decreased in all fields. What is the best action?

- A. Extubate and bag-mask ventilate
- B. Administer a bronchodilator
- C. Continue ventilating with Ambu bag
- D. Obtain a chest x-ray and ABG

Answer: D

Explanation:

A sudden drop in oxygen saturation with diminished breath sounds bilaterally suggests a possible ET tube issue, pneumothorax, or mucus plug. A chest x-ray is the most appropriate immediate step to identify the cause, and an ABG can assess ventilation status.

"Sudden desaturation in an intubated patient warrants immediate imaging and gas exchange assessment to identify pneumothorax, malpositioned tube, or obstruction." (Referenced from CCRN Pediatric - Direct Care: Pulmonary, Emergency Airway Complications)

NEW QUESTION # 136

For a patient with pulmonary aspiration, PEEP is used to:

- A. Decrease functional residual capacity
- B. Improve oxygenation
- C. Decrease PIP
- D. Decrease airway obstruction

Answer: B

Explanation:

Positive End-Expiratory Pressure (PEEP) helps keep alveoli open at end-expiration, thereby increasing functional residual capacity and improving gas exchange. In aspiration-related lung injury, alveolar collapse and inflammation impair oxygenation, so PEEP is used to recruit alveoli and improve oxygenation.

"PEEP increases oxygenation by preventing alveolar collapse, especially important in aspiration pneumonitis and ARDS. It improves oxygen delivery while minimizing barotrauma." (Referenced from CCRN Pediatric - Direct Care: Pulmonary, Mechanical Ventilation Strategies)

NEW QUESTION # 137

.....

Free4Dump have a huge senior IT expert team. They use their professional IT knowledge and rich experience to develop a wide range of different training plans which can help you pass AACN certification CCRN-Pediatric exam successfully. In Free4Dump you can always find out the most suitable training way for you to pass the exam easily. No matter you choose which kind of the training method, Free4Dump will provide you a free one-year update service. Free4Dump's information resources are very wide and also very accurate.
