### WGU Managing Cloud Security (JY02) Sample Questions (Q158-Q163):

#### NEW QUESTION # 158

Which design pillar encompasses the ability to support development and run workloads effectively, gain insights into operations, and continuously improve supporting processes to deliver business value?

- A. Reliability
- **B. Operational excellence**
- C. Performance efficiency
- D. Sustainability

**Answer: B**

Explanation:

The Operational Excellence pillar emphasizes practices that allow organizations to develop, deploy, and operate workloads effectively. It includes monitoring operations, responding to incidents, and continuously improving processes. By embedding feedback loops, organizations enhance agility and ensure that technology supports business value.

Performance efficiency deals with using computing resources efficiently, reliability ensures system availability, and sustainability focuses on environmental responsibility. While important, these do not encompass the process-driven improvements at the heart of operational excellence.

Operational excellence ensures that organizations can adapt quickly to changes, implement automation, and drive consistent improvements across cloud workloads. It is a key principle in cloud frameworks like AWS Well-Architected, Microsoft CAF, and Google's Reliability Engineering practices.

#### NEW QUESTION # 159

Which characteristic of cloud computing refers to sharing physical assets among multiple customers?

- **A. Resource pooling**
- B. On-demand self-service
- C. Measured service
- D. Rapid scalability

**Answer: A**

Explanation:

Resource pooling is one of the core characteristics of cloud computing defined by NIST. It refers to the provider's ability to serve multiple customers by dynamically allocating and reallocating computing resources such as storage, processing, memory, and network bandwidth. These resources are abstracted using virtualization, ensuring that customers remain isolated from one another even though they share the same physical assets.

Rapid scalability describes elasticity, on-demand self-service allows users to provision resources without provider intervention, and measured service refers to metering usage. None of these concepts directly describe the multi-tenant model of shared resources.

Resource pooling improves efficiency, reduces costs, and provides flexibility, but it also introduces new security considerations such as data isolation and hypervisor security. Customers must ensure that providers implement strong controls to prevent data leakage or cross-tenant compromise.

#### NEW QUESTION # 160

Which risk is assumed by an enterprise that chooses to use vendor-provided cloud resources?

- A. Loss of certification
- B. Lack of skilled technical personnel
- **C. Multitenant deployments**
- D. Incompatible infrastructure

**Answer: C**

Explanation:

By choosing vendor-provided cloud resources, an enterprise inherently assumes the risk associated with multitenant deployments. Managing Cloud principles explain that public and some community cloud environments are built on shared infrastructure where multiple customers' workloads coexist on the same physical hardware.

Although strong logical isolation mechanisms are implemented by cloud providers, multitenancy introduces risks such as data leakage, side-channel attacks, and resource contention. These risks do not exist to the same degree in dedicated on-premises environments. Enterprises must therefore rely on the provider's ability to enforce isolation, access control, and monitoring.

The other options are not intrinsic cloud risks. Incompatible infrastructure can be addressed through architecture design, lack of skilled personnel is an internal organizational issue, and loss of certification relates to compliance management. Therefore, multitenant deployments represent the risk assumed when using vendor-provided cloud resources.

#### **NEW QUESTION # 161**

Which item must be examined in detail when evaluating the risks associated with a new software as a service (SaaS) solution?

- A. Maintenance releases or patches to install
- B. Use of low-level accounts for administrative tasks
- C. Leverage of multi-factor authentication for all cloud access
- **D. Historical availability of services**

**Answer: D**

Explanation:

When evaluating the risks of a new Software as a Service (SaaS) solution, the historical availability of services must be examined in detail. Managing Cloud principles explain that availability is a critical risk factor because customers rely entirely on the provider to deliver uninterrupted access to applications and data.

Reviewing historical uptime, outage frequency, and incident response performance provides insight into the provider's operational maturity and resilience. Past availability metrics help organizations assess whether the SaaS provider can meet business continuity, disaster recovery, and service level expectations.

The other options represent security controls or operational activities but are not primary risk indicators during SaaS evaluation.

Administrative account usage and multi-factor authentication relate to access controls, while patching is managed by the provider in SaaS environments. Therefore, historical availability is the most relevant item to assess.

#### **NEW QUESTION # 162**

Which guide remedies the challenge of the international nature of cloud forensics and is known for becoming the premier standard for eDiscovery?

- A. ISO/IEC 27041:2015
- B. ISO/IEC 27042:2015
- C. ISO/IEC 27037:2012
- **D. ISO/IEC 27050-1:2016**

**Answer: D**

Explanation:

ISO/IEC 27050-1:2016 is the guide that addresses the international challenges of cloud forensics and is recognized as the premier standard for electronic discovery (eDiscovery). Managing Cloud documentation explains that eDiscovery involves identifying, collecting, preserving, and producing electronically stored information in legal proceedings.

This standard provides guidance for handling digital evidence across jurisdictions, which is especially important in cloud environments where data may reside in multiple countries. It establishes consistent processes and terminology to support legal defensibility and compliance.

The other ISO standards address evidence handling, investigation readiness, or incident management, but ISO/IEC 27050 specifically focuses on eDiscovery. Therefore, ISO/IEC 27050-1:2016 is the correct answer.
