GH-900考試重點 & GH-900證照

當你嘗試了我們提供的關於Microsoft GH-900認證考試的部分考題及答案,你可以對我們Fast2test做出選擇了，我們會100%為你提供方便以及保障。請記住能讓你100%通過Microsoft GH-900認證考試的就是我們的Fast2test。

最新的 GitHub Administrator GH-900 免費考試真題 (Q65-Q70):

問題 #65

A distributed version control system is best described as a system that:

- A. Ensures each developer has their own local copy of the entire code repository, including the complete project history and metadata.
- B. Relies on a central server to store the entire project history and allows developers to check out files for editing.
- C. Requires developers to manually track and manage different versions of their files using naming conventions and manual backups.
- D. Stores project files on a cloud-based server and allows multiple developers to collaborate on the same codebase simultaneously.

答案: A

解題說明:

A distributed version control system (DVCS) like Git is best described as a system that ensures each developer has their own local copy of the entire code repository, including the complete project history and metadata. This decentralized approach allows developers to work independently, with full access to the project's history and files, and later synchronize their changes with others. Unlike centralized systems, DVCS does not rely on a single central server, which provides greater flexibility and robustness in collaboration.

問題 #66

Which of the following best describes GitHub Copilot?

- A. A Visual Studio Code extension for developing AI solutions
- B. An AI tool designed to replace software developers
- **C. An AI pair programmer that offers autocomplete-style suggestions**
- D. An advanced search tool to intelligently reuse existing code in your projects

答案: C

解題說明:

GitHub Copilot is described as an AI pair programmer that offers autocomplete-style suggestions. It is a tool integrated into development environments like Visual Studio Code that helps developers by providing code suggestions as they type. Copilot can suggest entire lines or blocks of code based on the context of what you're writing, making it a valuable assistant in coding, but not a replacement for developers.

問題 #67

Which of the following describes a branch in Git?

- A. A new repository that shares code with the original "upstream" repository
- **B. A separate, isolated copy of the project's codebase**
- C. A pointer to an identical snapshot of the project at a specific point in time
- D. A physical copy of the entire project stored on disk

答案: B

解題說明:

In Git, a branch is a fundamental concept that represents an independent line of development within a project. Here's a more detailed explanation:

Branch in Git:

Option C is correct because a branch in Git is essentially a separate, isolated copy of the project's codebase where you can make changes without affecting the main codebase. Branches allow developers to work on features, fixes, or experiments in parallel to the main project.

Other Options:

Option A is incorrect because while a branch does point to a specific commit (which represents a snapshot of the project), the description lacks the emphasis on the isolated and parallel development aspect that is critical to the understanding of branches.

Option B is incorrect because a branch is not a physical copy stored on disk; it is a logical reference within the repository.

Option D is incorrect because that description better fits the concept of a fork, not a branch. A fork is a new repository that is a copy of another repository, usually used to contribute back to the original ("upstream") repository.

問題 #68

Which of the following can be performed within GitHub Desktop?

- A. Integrating with office suite software
- B. Creating and managing issues
- C. Commenting on discussions
- **D. Adding and cloning repositories**
- E. Reviewing and approving pull requests

答案: D

解題說明:

GitHub Desktop is a graphical interface that allows users to interact with GitHub repositories. It simplifies certain Git operations without the need for command-line usage.

GitHub Desktop Capabilities:

Option C is correct because GitHub Desktop allows users to add local repositories to their GitHub account, clone repositories from GitHub to their local machine, and manage repositories effectively.

Incorrect Options:

Option A is incorrect because GitHub Desktop does not support creating or managing issues directly; this is done through the GitHub web interface.

Option B is incorrect because reviewing and approving pull requests is also managed through the GitHub web interface.

Option D is incorrect because commenting on discussions is done on the GitHub platform, not through GitHub Desktop.

Option E is incorrect because GitHub Desktop does not integrate with office suite software.

問題 #69

What does a CODEOWNERS file do in a repository?

- A. Restricts who can edit specific files
- B. Defines access permissions for the repository
- C. Sets the reviewers for pull requests automatically
- D. Requires peer code review for code changes

答案： C

解題說明：

The CODEOWNERS file in a GitHub repository is used to define individuals or teams that are responsible for specific parts of the codebase. When changes are made to files or directories that match the patterns specified in the CODEOWNERS file, GitHub automatically requests reviews from the listed code owners.

Setting Reviewers Automatically:

Option D is correct because the primary purpose of a CODEOWNERS file is to automatically set reviewers for pull requests that affect the specified files or directories. This ensures that the appropriate team members are notified and review the changes before they are merged.

Incorrect Options:

Option A is incorrect because the CODEOWNERS file does not restrict who can edit specific files; it only influences who is required to review changes.

Option B is partially related but not fully accurate because while CODEOWNERS does require certain reviews, it does not mandate peer review for all code changes.

Option C is incorrect because the CODEOWNERS file does not define access permissions for the repository; it deals with code review processes.
