Free PDF JN0-224 - Automation and DevOps, Associate (JNCIA-DevOps) High Hit-Rate Exam Guide

Our website is a very secure and regular platform. Firstly, we guarantee the security of the company's website whiling purchasing process of JN0-224 exam torrent. Secondly, for all customer information about purchasing JN0-224 practice test, we will be maintained by specialized personnel and absolutely no information disclosure will occur. To the last but also the most important, our JN0-224 Exam Materials have the merit of high quality based on the high pass rate as 98% to 100%. The data speak louder than the other words. You should be confident with our JN0-224 training prep.

Juniper Automation and DevOps, Associate (JNCIA-DevOps) Sample Questions (Q25-Q30):

NEW QUESTION # 25

Which DevOps "Three way" principle addresses technical debt?

- A. continuous experimentation and learning
- B. feedback
- C. continuous experimentation
- D. flow

Answer: B

Explanation:

In the context of the DevOps "Three Ways" principles, the feedback principle directly addresses the management of technical debt. The "Three Ways" are core principles guiding DevOps practices, and they are as follows:

Flow: Refers to the smooth and fast flow of work through the system, from development to operations.

Feedback: Emphasizes creating effective, fast, and continuous feedback loops between teams to catch issues early, address

technical debt, and ensure quality.

Continuous experimentation and learning: Encourages constant experimentation, innovation, and learning from failures to improve systems and processes over time.

Feedback and Technical Debt:

Feedback loops play a crucial role in addressing technical debt. Technical debt refers to the implied cost of additional work that arises when code or system design decisions are made for short-term gains, such as quick fixes or temporary patches. Over time, technical debt can accumulate and degrade system performance, reliability, and maintainability.

The feedback loop ensures that issues related to technical debt (such as poor code quality, design shortcuts, or performance bottlenecks) are caught early in the process, ideally before they become major problems. Continuous monitoring, testing, and reviewing help identify and resolve technical debt incrementally rather than letting it accumulate unchecked.

Automation in feedback loops: In DevOps, automated testing, continuous integration (CI), and monitoring tools provide immediate feedback to developers, highlighting areas where technical debt is increasing. This feedback is crucial for making proactive decisions about refactoring code or improving infrastructure without waiting for problems to manifest in production.

For instance, the feedback loop might expose slowdowns in application performance after each new feature is added. This would trigger a review to either refactor the feature code or improve system resources, preventing further technical debt accumulation.

Flow and Technical Debt:

While flow focuses on the smooth transition of work through the pipeline, it indirectly helps with technical debt by ensuring continuous and streamlined processes. However, feedback mechanisms are the primary tools for identifying and resolving technical debt.

Continuous Experimentation and Learning:

This principle promotes innovation and learning from failures but does not directly address technical debt. The focus here is more on risk-taking and improvement rather than managing or eliminating technical debt.

Reference from DevOps Practices:

The Phoenix Project, a book often referenced in DevOps, discusses how feedback loops are essential for maintaining system integrity and managing technical debt effectively. By improving feedback mechanisms, teams can address small issues before they become costly to fix.

The DevOps Handbook also highlights the importance of feedback in managing technical debt, emphasizing that fast feedback allows for continuous improvement and avoids the accumulation of bad practices that would otherwise lead to technical debt.

Juniper Automation and DevOps Context: Juniper's automation frameworks integrate feedback mechanisms using tools like continuous monitoring and automated testing. These tools help engineers track the health of network systems, identify configuration drifts, and resolve issues before they lead to significant technical debt.

NEW QUESTION # 26

Which two statements are valid regarding Junos automation? (Choose two.)

- A. The mgd process handles JET API requests.
- **B. The jsd process handles JET API requests.**
- C. The mod process handles XML API calls.
- **D. The jsd process handles XML API calls.**

Answer: B,D

Explanation:

In Junos automation, several processes handle API requests, and understanding which process handles what is crucial:

jsd Process:

XML API Calls (A): The jsd process is responsible for handling XML API calls, which are a significant part of Junos automation. XML API allows for structured and standardized communication with Junos devices, enabling automation scripts to query and configure devices.

JET API Requests (C): The jsd process also handles JET (Junos Extension Toolkit) API requests. JET provides a more modern, programmable interface for interacting with Junos OS, and jsd is the process that manages these interactions.

mgd Process (Incorrect Option):

Not for JET API Requests: The mgd process handles general management operations, such as CLI commands and managing the configuration database, but it does not handle JET API requests. That role is fulfilled by jsd.

mod Process (Incorrect Option):

Not for XML API Calls: The mod process deals with managing chassis components and is not involved in handling XML API calls.

Reference:

Juniper Networks JET and XML API Documentation: Describes the roles of jsd in handling both XML and JET API requests.

NEW QUESTION # 27

Which two statements about NETCONF are correct? (Choose two.)

- A. NETCONF cannot use the default SSH port.
- **B. NETCONF can use the default SSH port.**
- C. The default port for NETCONF is port 930.
- **D. The default port for NETCONF is port 830.**

Answer: B,D

Explanation:

NETCONF (Network Configuration Protocol) is used for network device management and can operate over SSH. The following are true about NETCONF:

Default Port 830 (B): By default, NETCONF uses port 830 for communication over SSH. This is the standard port reserved for NETCONF sessions.

Use of Default SSH Port (D): NETCONF can also operate over the standard SSH port (port 22) if configured to do so. This allows flexibility in network management scenarios where port 830 might not be available or used.

Options A and C are incorrect because they refer to incorrect or non-applicable port numbers for NETCONF.

Reference:

IETF RFC 6241: Specifies the use of NETCONF over SSH, including port details.

Juniper Networks NETCONF Documentation: Discusses the configuration and operation of NETCONF on Junos devices, including port usage.

NEW QUESTION # 28

Why is a REST API considered stateless?

- **A. The client requests to the server do not include state information.**
- B. The state of the server is not important when making requests.
- C. No client context is stored on the server between requests.
- D. The REST API is an international API.

Answer: A

NEW QUESTION # 29

Which two statements about NETCONF are true? (Choose two.)

- A. It uses the messages layer to lock the configuration of a Junos device.
- **B. It uses the operations layer to commit the configuration of a Junos device.**
- C. It uses the messages layer to commit the configuration of a Junos device.
- **D. It uses the operations layer to lock the configuration of a Junos device.**

Answer: B,D

Explanation:

NETCONF (Network Configuration Protocol) operates through different layers, with the operations layer being particularly important for managing configurations:

Operations Layer (A & D): This layer is responsible for actions like locking and committing the configuration on a Junos device. The lock operation prevents other sessions from modifying the configuration, and the commit operation applies the configuration changes to the device.

Options B and C are incorrect because the messages layer handles the communication aspects, such as exchanging data between the client and server, not performing configuration operations like locking and committing.

Reference:

IETF RFC 6241 (NETCONF): Describes the protocol layers and their functions, with a focus on the operations layer.

Juniper Networks NETCONF Documentation: Provides insights into how NETCONF operations are managed in Junos
