100% Pass Quiz 2026 Authoritative AWS-Developer: Reliable AWS Certified Developer Associate Exam (DVA-C02) Exam Answers

Our company will promptly update our AWS-Developer exam materials based on the changes of the times and then send it to you timely. 99% of people who use our learning materials have passed the exam and successfully passed their certificates, which undoubtedly show that the passing rate of our AWS-Developer Test Torrent is 99%. If you fail the exam, we promise to give you a full refund in the shortest possible time. So our product is a good choice for you. Choosing our AWS-Developer study tool can help you learn better. You will gain a lot and lay a solid foundation for success.

The AWS Certified Developer – Associate certificate is appropriate for individuals who occupy the position of a developer and who want to upgrade their skills. This certification helps candidates understand how to use AWS core services.

Amazon AWS Certified Developer Associate Exam (DVA-C02) Sample Questions (Q349-Q354):

NEW QUESTION # 349

Which of the following notification endpoints or clients does Amazon Simple Notification Service support?
Choose 2 answers

- **A. Short Message Service**
- B. CloudFront distribution
- **C. Email**
- D. File Transfer Protocol
- E. Simple Network Management Protocol

Answer: A,C

NEW QUESTION # 350

A development team is migrating a monolithic application to Amazon API Gateway with AWS Lambda integrations using the AWS CD The zip deployment package exceeds the Lambda direct upload deployment package size limit. How should the Lambda function be deployed?

- A. Use the zip file to create a Lambda layer and reference it using the `-code` CLI parameter
- B. Upload a deployment package using the `--zip-file` CLI parameter
- C. Create a Docker image and reference the image using the `--docker-image` CLI parameter
- **D. Upload a deployment package to Amazon S3 and reference Amazon S3 using the `--code` CLI parameter**

Answer: D

NEW QUESTION # 351

Which of the following solutions is not supported by DynamoDB:

- A. Hash Primary Key
- **B. Hash secondary index**
- C. Local secondary index
- D. Global secondary index

Answer: B

Explanation:

In DynamoDB, a secondary index is a data structure that contains a subset of attributes from a table, along with an alternate key to support Query operations. DynamoDB supports the following two types of secondary indexes:

Local secondary index is an index that has the same hash key as the table, but a different range key. A local secondary index is "local" in the sense that every partition of a local secondary index is scoped to a table partition that has the same hash key.

Global secondary index is an index with a hash and range key that can be different from those on the table. A global secondary index is considered "global" because queries on the index can span all of the data in a table, across all partitions.

NEW QUESTION # 352

A company is building a stock trading application that requires sub-millisecond latency in processing trading requests. Amazon DynamoDB is used to store all the trading data that is used to process each request. After load testing the application, the development team found that due to data retrieval times, the latency requirement is not satisfied. Because of sudden high spikes in the number of requests, DynamoDB read capacity has to be significantly over-provisioned to avoid throttling.

What steps should be taken to meet latency requirements and reduce the cost of running the application?

- A. Store trading data in Amazon S3 and use Transfer Acceleration.
- B. Add Global Secondary Indexes for trading data.
- **C. Use DynamoDB Accelerator to cache trading data.**
- D. Add retries with exponential back-off for DynamoDB queries

Answer: C

NEW QUESTION # 353

A developer is building a serverless application hosted on AWS that uses Amazon Redshift as a data store.

The application has separate module for read/write and read-only functionality. The modules need their own database users for compliance reasons.

Which combination of steps should a security engineer implement to grant appropriate access? (Choose two.)

- **A. Create local database users for each module.**
- **B. Configure cluster security groups for each application module to control access to database users that are required for read-only and read-write.**

- C. Configure an IAM policy for each module. Specify the ARN of an Amazon Redshift database user that allows the GetClusterCredentials API call.
- D. Configure a VPC endpoint for Amazon Redshift. Configure an endpoint policy that maps database users to each application module, and allow access to the tables that are required for read-only and read/write.
- E. Configure an IAM policy for each module. Specify the ARN of an IAM user that allows the GetClusterCredentials API call.

Answer: A,B
