Salesforce Certified MuleSoft Integration Associate Exam Sample Questions (Q34-Q39):

NEW QUESTION # 34
What is an advantage of using OAuth 2 0 client credentials and access tokens over only API keys for API authentication?

- A. If the client ID is compromised it can be exchanged for an API key
- B. If the access token is compromised, the client credentials do not have to be reissued
- C. If the access token is compromised it can be exchanged for an API key

- D. If the client secret is compromised, the client credentials do not have to be reissued

Answer: B

Explanation:
OAuth 2.0 provides a more secure and flexible way of handling API authentication compared to API keys.
Here's a detailed explanation of the advantage mentioned:
* OAuth 2.0 Client Credentials Grant:
* How It Works: In this flow, a client application uses its client ID and client secret to obtain an access token from the authorization server.
* Access Tokens: These tokens are short-lived and used to authenticate API requests.
* Security Advantages:
* Token Compromise: If an access token is compromised, it only grants limited access because it has a short lifespan and can be easily revoked.
* Client Credentials: The client credentials (client ID and secret) are not exposed during API calls, reducing the risk of them being compromised.
* Token Refresh: New tokens can be obtained without exposing the client credentials again.
* Comparison with API Keys:
* API Keys: If an API key is compromised, it often provides long-term access without expiration.
Revoking the API key impacts all users or applications using it.
* OAuth Tokens: Compromised tokens can be individually revoked without needing to change the client credentials, minimizing disruption.

NEW QUESTION # 35
An API client makes an HTTP request to an API gateway with an Accept header containing the value
"application/json"
What is a valid HTTP response payload for this request in the client's requested data format?

- A. <status>healthy< 'status>
- B. {"status" -healthy-}
- C. status('healthy')
- D. status: healthy

Answer: B

Explanation:
When an API client makes an HTTP request with an Accept header containing the value "application/json", the API server should respond with a payload formatted as JSON. Here's a detailed explanation:
* Accept Header:
* Purpose: The Accept header indicates the media type(s) that the client is willing to receive from the server.
* Value "application/json": Specifies that the client expects a response in JSON format.
* Valid JSON Response:
* Format: JSON (JavaScript Object Notation) is a lightweight data interchange format that uses key-value pairs.
* Example: A valid JSON response for the requested format would be{"status": "healthy"}.
* Key: "status"
* Value: "healthy"

NEW QUESTION # 36
An organization needs to procure an enterprise software system to increase cross-selling opportunities and better track prospect data.
Which category of enterprise software has these core capabilities,when used for its typical andintended purpose?

- A. Business-to-Business (B2B)

- B. IT Service Management (ITSM)
- C. Supply Cham Management (SCM)
- D. Customer Relationship Management (CRM)

Answer: D

Explanation:
Customer Relationship Management (CRM) systems are designed to manage an organization's interactions with current and potential customers. Here's a detailed explanation:
* Core Capabilities:
* Cross-Selling Opportunities: CRM systems track customer interactions, preferences, and purchasing history, helping businesses identify opportunities for cross-selling and upselling.
* Prospect Data Management: CRM systems manage prospect information, track leads, and nurture relationships through the sales funnel.
* Typical Use:
* Sales Management: Helps sales teams manage and analyze customer interactions and data throughout the customer lifecycle.
* Marketing Automation: Assists in automating marketing campaigns, segmenting customer lists, and tracking campaign effectiveness.
* Customer Service: Provides tools for managing customer support cases, improving customer
* satisfaction, and retaining customers.

NEW QUESTION # 37
An IT integration team followed an API-led connectivity approach to implement an order-fulfillment business process It created an order processing API that coordinates stateful interactions with a variety of microservices that validate, create and fulfill new product orders.
Which interaction composition pattern did the integration architect who designed this order processing API use?

- A. Orchestration
- B. Multicasting
- C. Aggregation
- D. Streaming

Answer: A

Explanation:
In an API-led connectivity approach, different APIs are layered to provide modular and reusable services. For an order processing API that coordinates stateful interactions with various microservices, the integration architect used the orchestration interaction composition pattern. Here's a step-by-step explanation:
* Understanding Orchestration:
* Definition: Orchestration involves coordinating multiple services to achieve a complex business workflow. Unlike choreography, which relies on each service knowing its part, orchestration uses a central controller to manage the interactions.
* Role of the Orchestrator: The orchestrator manages the execution sequence, handles the state, and ensures all the necessary steps are completed successfully.
* Order Processing API:
* API-Led Connectivity: An order processing API, following API-led connectivity, sits in the Process layer, handling complex business processes and logic.
* Stateful Interactions: Orchestration is particularly suitable for stateful interactions where the process needs to remember the state between steps, such as validating an order, creating it, and fulfilling it.
* Implementation Steps:
* Microservices Interaction: The order processing API interacts with various microservices:
* Validation Microservice: Checks the validity of the order details.
* Creation Microservice: Creates the order in the system.
* Fulfillment Microservice: Manages the order fulfillment process.
* Coordination: The API orchestrates these steps, ensuring each one completes successfully before moving to the next, handling exceptions, and maintaining the state of the process.

NEW QUESTION # 38
An application load balancer routes requests to a RESTful web API secured by Anypomt Flex Gateway Which protocol is involved in the communication between the load balancer and the Gateway?

* A. SMTP
* B. SFTP
* C. LDAP
* D. HTTPS

Answer: D

Explanation:
In scenarios where an application load balancer routes requests to a RESTful web API secured by Anypoint Flex Gateway, HTTPS is the protocol used. Here's a detailed explanation:
* HTTPS Protocol:
* Definition: HTTPS (HyperText Transfer Protocol Secure) is an extension of HTTP that provides secure communication over a computer network.
* Encryption: It uses SSL/TLS to encrypt the data exchanged between the client and server, ensuring privacy and data integrity.
* Load Balancer to Gateway Communication:
* Secure Communication: The load balancer routes incoming requests to the API Gateway using HTTPS, ensuring that the data is encrypted and secure.
* Standard Practice: HTTPS is the standard protocol for securing API communications, protecting against eavesdropping and man-in-the-middle attacks.
