Palo Alto Networks Certified Network Security Engineer Exam Sample Questions (Q102-Q107):

NEW QUESTION # 102

A network security engineer must implement Quality of Service policies to ensure specific levels of delivery guarantees for various applications in the environment. They want to ensure that they know as much as they can about QoS before deploying. Which statement about the QoS feature is correct?

- A. QoS can be used in conjunction with SSL decryption
- B. QoS is only supported on hardware firewalls
- C. QoS can be used on firewalls with multiple virtual systems configured
- D. QoS is only supported on firewalls that have a single virtual system configured

Answer: C

NEW QUESTION # 103

A network administrator wants to deploy SSL Forward Proxy decryption. What two attributes should a forward trust certificate have? (Choose two.)

- A. A private key
- B. A certificate authority (CA) certificate
- C. A server certificate
- D. A subject alternative name

Answer: A,B

Explanation:

When deploying SSL Forward Proxy decryption, a forward trust certificate must have a subject alternative name (SAN) and be a server certificate. SAN is an extension to the X.509 standard that allows multiple domain names to be protected by a single SSL/TLS certificate. It is used to identify the domain names or IP addresses that the certificate should be valid for. A private key is also required but it is not mentioned in the options. A certificate authority (CA) certificate is not required as the forward trust certificate itself is a CA certificate.

NEW QUESTION # 104

What are three valid methods of user mapping? (Choose three)

- A. WildFire
- B. XML API
- C. 802.1X
- D. Server Monitoring
- E. Syslog

Answer: B,D,E

NEW QUESTION # 105

When a malware-infected host attempts to resolve a known command-and-control server, the traffic matches a security policy with DNS sinkhole enabled, generating a traffic log.

What will be the destination IP address in that log entry?

- A. The IP address of one of the external DNS servers identified in the anti-spyware database.
- **B. The IP address specified in the sinkhole configuration.**
- C. The IP address of the command-and-control server.
- D. The IP address of sinkhole.paloaltonetworks.com

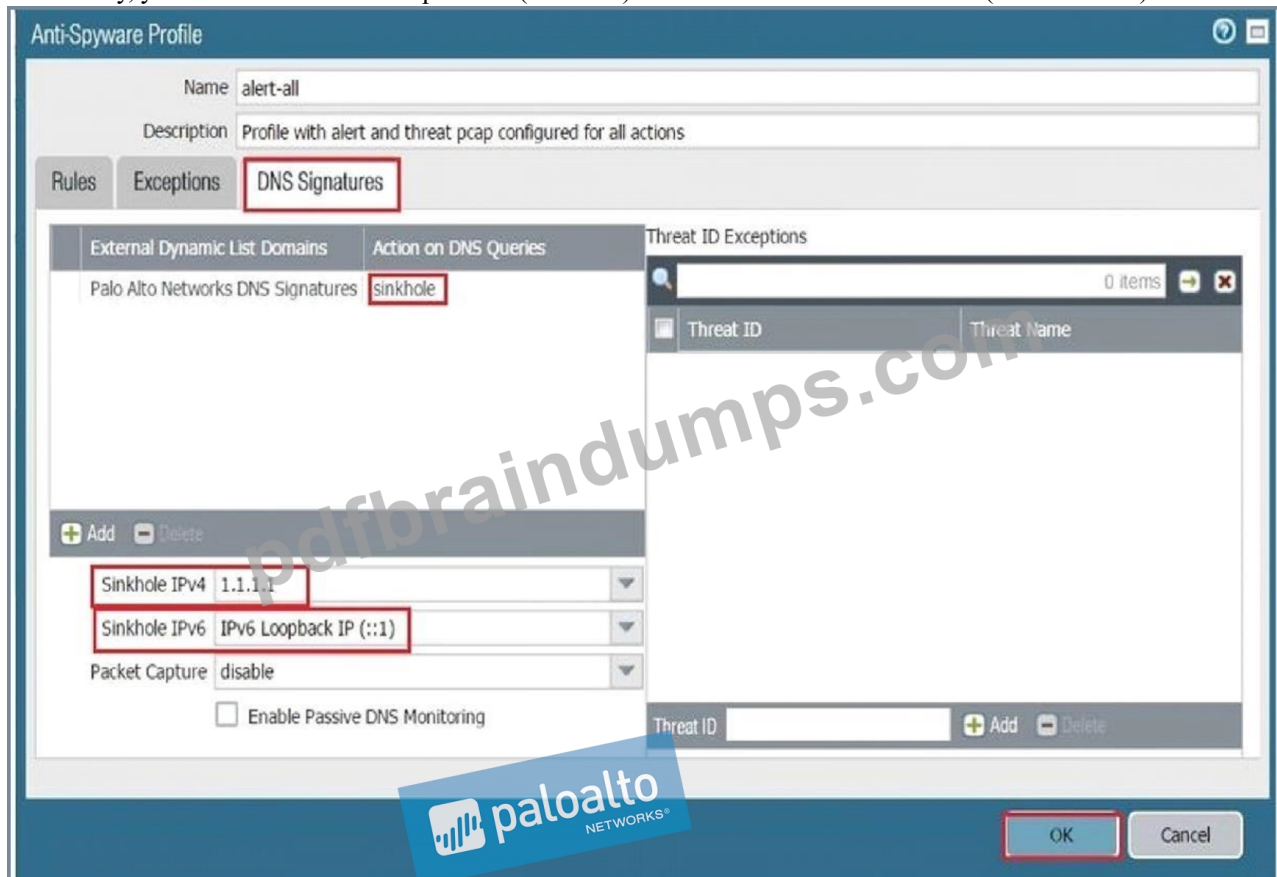

Answer: B

Explanation:

Change the "Action on DNS queries" to 'sinkhole'.

Click in the Sinkhole IPv4 field and type in the fake IP. The example here shows using 1.1.1.1 for simplicity, but as long as this fake IP is not used inside of the network, then it should be Ok.

Alternatively, you can also use either a Loopback IP (127.0.0.1) or Palo Alto Networks Sinkhole IP (71.19.152.112).

NEW QUESTION # 106

A network security engineer needs to ensure that virtual systems can communicate with one another within a Palo Alto Networks firewall. Separate virtual routers (VRs) are created for each virtual system.

In addition to confirming security policies, which three configuration details should the engineer focus on to ensure communication between virtual systems? {Choose three.}

- **A. Add a route with next hop next-vr by using the VR configured in the virtual system.**
- **B. External zones with the virtual systems added.**
- **C. Ensure the virtual systems are visible to one another.**
- D. Layer 3 zones for the virtual systems that need to communicate.
- E. Add a route with next hop set to none, and use the interface of the virtual systems that need to communicate.

Answer: A,B,C

Explanation:

For virtual systems (vSys) on a Palo Alto Networks firewall to communicate with each other, especially when separate virtual routers (VRs) are used for each vSys, the configuration must facilitate proper routing and security policy enforcement. The key aspects to focus on include:

A . External zones with the virtual systems added:

External zones are special types of zones that are used to facilitate traffic flow between virtual systems within the same physical firewall. By adding virtual systems to an external zone, you enable them to communicate with each other, effectively bypassing the need for traffic to exit and re-enter the firewall.

D . Add a route with next hop next-vr by using the VR configured in the virtual system:

When using separate VRs for each vSys, it's essential to configure inter-VR routing. This is done by adding routes in each VR with the next hop set to 'next-vr', specifying the VR of the destination vSys. This setup enables traffic to be routed from one virtual system's VR to another, facilitating communication between them.

E . Ensure the virtual systems are visible to one another:

Visibility between virtual systems is a prerequisite for inter-vSys communication. This involves configuring the virtual systems in a way that they are aware of each other's existence. This is typically managed in the vSys settings, where you can specify which virtual systems can communicate with each other.

By focusing on these configuration details, the network security engineer can ensure that the virtual systems can communicate effectively, maintaining the necessary isolation while allowing the required traffic flow.
