

# Pass Guaranteed Quiz 2026 Amazon AWS-Solutions-Associate Marvelous Test Dumps Demo

P.S. Free & New AWS-Solutions-Associate dumps are available on Google Drive shared by BootcampPDF:  
[https://drive.google.com/open?id=1sU0-ME-LmKfPbLNDGn-Xg6DoqO1IFpa\\_](https://drive.google.com/open?id=1sU0-ME-LmKfPbLNDGn-Xg6DoqO1IFpa_)

If you are always complaining that you are too spread, are overwhelmed with the job at hand, and struggle to figure out how to prioritize your efforts, these would be the basic problem of low efficiency and production. You will never doubt anymore with our AWS-Solutions-Associate test prep. Moreover for all your personal information, we will offer protection acts to avoid leakage and virus intrusion so as to guarantee the security of your privacy. What is most important is that when you make a payment for our AWS-Solutions-Associate Quiz torrent, you will possess this product in 5-10 minutes and enjoy the pleasure and satisfaction of your study time.

The AWS SAA-C02 certification exam covers a wide range of topics, including AWS architecture, designing highly available systems, security and compliance, and deployment and management of AWS services. AWS-Solutions-Associate exam is designed to test the candidate's ability to identify and define technical requirements for an AWS-based application, design and deploy scalable and highly available systems, and implement and manage AWS services. AWS-Solutions-Associate Exam Format includes multiple-choice and multiple-response questions, and the duration of the exam is 130 minutes.

## Solutions-Associate Exams

We know making progress and getting the certificate of AWS-Solutions-Associate study materials will be a matter of course with the most professional experts in command of the newest and the most accurate knowledge in it. Our AWS Certified Solutions Architect - Associate (SAA-C03) exam prep has taken up a large part of market. with decided quality to judge from customers' perspective, If you choose the right AWS-Solutions-Associate Practice Braindumps, it will be a wise decision. Our behavior has been strictly ethical and responsible to you, which is trust worthy.

The AWS-Solutions-Associate certification exam is a must-have for professionals who want to demonstrate their expertise in designing and deploying secure and robust applications on AWS. AWS Certified Solutions Architect - Associate (SAA-C03) certification is recognized globally and opens up various career opportunities in cloud computing. With the increasing demand for cloud computing professionals, this certification is a great way to gain a competitive edge in the job market.

Amazon AWS-Solutions-Architect-Associate exam, also known as the AWS Certified Solutions Architect - Associate (SAA-C02) exam, is a certification exam offered by Amazon Web Services (AWS) for IT professionals who want to demonstrate their knowledge and skills in designing and deploying scalable, highly available, and fault-tolerant systems on AWS. AWS-Solutions-Associate Exam is designed to test the candidate's knowledge of AWS services, best practices, and architectures for building and deploying cloud-based solutions.

### Amazon AWS Certified Solutions Architect - Associate (SAA-C03) Sample Questions (Q158-Q163):

#### NEW QUESTION # 158

A company needs a solution to integrate transaction data from several Amazon DynamoDB tables into an existing Amazon Redshift data warehouse. The solution must maintain the provisioned throughput of DynamoDB.

Which solution will meet these requirements with the LEAST operational overhead?

- A. Create an Amazon S3 bucket. Configure an AWS Lambda function to read from the DynamoDB tables and write to the S3 bucket on a regular schedule. Use Amazon Redshift Spectrum to access the data in the S3 bucket.
- B. Use an Amazon Redshift COPY command to read directly from each DynamoDB table.
- C. Use Amazon Athena Federated Query with a DynamoDB connector and an Amazon Redshift connector to read directly from the DynamoDB tables.
- **D. Create an Amazon S3 bucket. Configure DynamoDB to export to the bucket on a regular schedule. Use an Amazon Redshift COPY command to read from the S3 bucket.**

#### Answer: D

Explanation:

DynamoDB export to Amazon S3 (via point-in-time exports or table backups) "does not consume read capacity" and has no impact on table performance. Once data is in S3, Amazon Redshift can ingest efficiently with COPY from S3, which is the standard, parallel, high-throughput load path with minimal management.

Direct COPY from DynamoDB (B) performs a table scan that can consume provisioned throughput, risking throttling. Building Lambda pipelines (C) adds custom code and scheduling overhead. Athena federated queries (D) are ad hoc analytics, not optimized for bulk, recurring warehouse loads. Therefore, exporting to S3 and loading with Redshift COPY maintains DynamoDB throughput and minimizes operational burden.

References: DynamoDB - "Export to S3 (no RCU consumption)"; Amazon Redshift - "COPY from Amazon S3 (parallel load)"; AWS Big Data best practices - "Stage data in S3 for Redshift loads."

#### NEW QUESTION # 159

A newspaper organization has a on-premises application which allows the public to search its back catalogue and retrieve individual newspaper pages via a website written in Java They have scanned the old newspapers into JPEGs (approx 17TB) and used Optical Character Recognition (OCR) to populate a commercial search product. The hosting platform and software are now end of life and the organization wants to migrate Its archive to AWS and produce a cost efficient architecture and still be designed for availability and durability Which is the most appropriate?

- **A. Use S3 with standard redundancy to store and serve the scanned files, use CloudSearch for query processing, and use Elastic Beanstalk to host the website across multiple availability zones.**
- B. Use S3 with reduced redundancy to store and serve the scanned files, install the commercial search application on EC2 Instances and configure with auto-scaling and an Elastic Load Balancer.

- C. Use a CloudFront download distribution to serve the JPEGs to the end users and Install the current commercial search product, along with a Java Container Tor the website on EC2 instances and use Route53 with DNS round-robin.
- D. Use a single-AZ RDS MySQL instance lo store the search index 33d the JPEG images use an EC2 instance to serve the website and translate user queries into SQL.
- E. Model the environment using CloudFormation use an EC2 instance running Apache webserver and an open source search application, stripe multiple standard EBS volumes together to store the JPEGs and search index.

**Answer: A**

#### NEW QUESTION # 160

A company is planning to use an Amazon DynamoDB table for data storage. The company is concerned about cost optimization. The table will not be used on most mornings. In the evenings, the read and write traffic will often be unpredictable. When traffic spikes occur, they will happen very quickly.

What should a solutions architect recommend?

- A. Create a DynamoDB table with provisioned capacity and auto scaling.
- B. Create a DynamoDB table in provisioned capacity mode, and configure it as a global table
- C. Create a DynamoDB table with a global secondary index
- **D. Create a DynamoDB table in on-demand capacity mode.**

**Answer: D**

Explanation:

Provisioned capacity is best if you have relatively predictable application traffic, run applications whose traffic is consistent, and ramps up or down gradually. On-demand capacity mode is best when you have unknown workloads, unpredictable application traffic and also if you only want to pay exactly for what you use. The on-demand pricing model is ideal for bursty, new, or unpredictable workloads whose traffic can spike in seconds or minutes, and when under-provisioned capacity would impact the user experience.

<https://docs.aws.amazon.com/wellarchitected/latest/serverless-applications-lens/capacity.html>

#### NEW QUESTION # 161

A company hosts its application on AWS The company uses Amazon Cognito to manage users When users log in to the application the application fetches required data from Amazon DynamoDB by using a REST API that is hosted in Amazon API Gateway. The company wants an AWS managed solution that will control access to the REST API to reduce development efforts Which solution will meet these requirements with the LEAST operational overhead?

- **A. Configure an Amazon Cognito user pool authorizer in API Gateway to allow Amazon Cognito to validate each request**
- B. Send the user's email address in the header with every request Invoke an AWS Lambda function to validate that the user with that email address has proper access
- C. For each user, create and assign an API key that must be sent with each request Validate the key by using an AWS Lambda function
- D. Configure an AWS Lambda function to be an authorize! in API Gateway to validate which user made the request

**Answer: A**

Explanation:

<https://docs.aws.amazon.com/apigateway/latest/developerguide/apigateway-integrate-with-cognito.html> To control access to the REST API and reduce development efforts, the company can use an Amazon Cognito user pool authorizer in API Gateway. This will allow Amazon Cognito to validate each request and ensure that only authenticated users can access the API. This solution has the LEAST operational overhead, as it does not require the company to develop and maintain any additional infrastructure or code.

#### NEW QUESTION # 162

A company wants to direct its users to a backup static error page if the company's primary website is unavailable. The primary website's DNS records are hosted in Amazon Route 53. The domain is pointing to an Application Load Balancer (ALB). The company needs a solution that minimizes changes and infrastructure overhead.

Which solution will meet these requirements?

- A. Update the Route 53 records to use a multivalue answer routing policy. Create a health check. Direct traffic to the website

if the health check passes. Direct traffic to a static error page that is hosted in Amazon S3 if the health check does not pass.

- **B. Set up a Route 53 active-passive failover configuration. Direct traffic to a static error page that is hosted in an Amazon S3 bucket when Route 53 health checks determine that the ALB endpoint is unhealthy.**
- C. Update the Route 53 records to use a latency routing policy. Add a static error page that is hosted in an Amazon S3 bucket to the records so that the traffic is sent to the most responsive endpoints.
- D. Set up a Route 53 active-active configuration with the ALB and an Amazon EC2 instance that hosts a static error page as endpoints. Configure Route 53 to send requests to the instance only if the health checks fail for the ALB.

**Answer: B**

Explanation:

Explanation

This solution meets the requirements of directing users to a backup static error page if the primary website is unavailable, minimizing changes and infrastructure overhead. Route 53 active-passive failover configuration can route traffic to a primary resource when it is healthy or to a secondary resource when the primary resource is unhealthy. Route 53 health checks can monitor the health of the ALB endpoint and trigger the failover when needed. The static error page can be hosted in an S3 bucket that is configured as a website, which is a simple and cost-effective way to serve static content.

Option A is incorrect because using a latency routing policy can route traffic based on the lowest network latency for users, but it does not provide failover functionality. Option C is incorrect because using an active-active configuration with the ALB and an EC2 instance can increase the infrastructure overhead and complexity, and it does not guarantee that the EC2 instance will always be healthy. Option D is incorrect because using a multivalue answer routing policy can return multiple values for a query, but it does not provide failover functionality.
