ISA/IEC 62443 Cybersecurity Fundamentals Specialist Sample Questions (Q197-Q202):

NEW QUESTION # 197

According to ISA/IEC TR 62443-1-5, which documents can be referenced when creating a security profile?

- **A. ISA/IEC 62443-2-1, 2-4, 3-3, 4-1, and 4-2**
- B. Any cybersecurity standard outside the ISA/IEC 62443 series
- C. Only ISA/IEC 62443-3-3 and 4-1
- D. Only ISA/IEC 62443-1-1 and 1-2

Answer: A

Explanation:

ISA/IEC TR 62443-1-5 provides formal guidance on the creation and structure of cybersecurity profiles within the ISA/IEC 62443 framework. A security profile is intended to tailor existing requirements to a specific industry sector, application, or use case without altering the integrity of the base standard.

Step 1: Purpose of a security profile

The technical report clarifies that profiles are selections and combinations of existing requirements, not a mechanism to invent new controls. Profiles ensure consistent application of ISA/IEC 62443 while addressing sector-specific risk, regulatory, or operational needs.

Step 2: Authorized source documents

TR 62443-1-5 explicitly states that security profiles may reference requirements from:

- * ISA/IEC 62443-2-1 (asset owner security program requirements)
- * ISA/IEC 62443-2-4 (service provider requirements)
- * ISA/IEC 62443-3-3 (system security requirements)
- * ISA/IEC 62443-4-1 (secure product development lifecycle)
- * ISA/IEC 62443-4-2 (technical component requirements)

These documents collectively cover organizational, system, and component security.

Step 3: Why other options are incorrect

- * Limiting profiles to only Parts 3-3 and 4-1 excludes governance and lifecycle requirements.
- * Parts 1-1 and 1-2 are foundational and definitional, not requirement sources.
- * Referencing standards outside the 62443 family violates the intent of maintaining internal consistency.

Step 4: Standard integrity

By restricting profiles to these documents, ISA ensures profiles remain interoperable, auditable, and certifiable.

Thus, Option C is the only correct answer.

NEW QUESTION # 198

Which of the following is a recommended default rule for IACS firewalls?

Available Choices (select all choices that are correct)

- **A. Block all traffic by default.**
- B. Allow IACS devices to access the Internet.
- C. Allow traffic directly from the IACS network to the enterprise network.
- D. Allow all traffic by default.

Answer: A

Explanation:

A recommended default rule for IACS firewalls is to block all traffic by default, and then allow only the necessary and authorized traffic based on the security policy and the zone and conduit model. This is also known as the principle of least privilege, which means granting the minimum access required for a legitimate purpose. Blocking all traffic by default provides a higher level of security and reduces the attack surface of the IACS network. The other choices are not recommended default rules for IACS firewalls, as they may expose the IACS network to unnecessary risks. Allowing all traffic by default would defeat the purpose of a firewall, as it would not filter any malicious or unwanted traffic. Allowing IACS devices to access the Internet would expose them to potential cyber threats, such as malware, phishing, or denial-of-service attacks.

Allowing traffic directly from the IACS network to the enterprise network would bypass the demilitarized zone (DMZ), which is a buffer zone that isolates the IACS network from the enterprise network and hosts services that need to communicate between them.

NEW QUESTION # 199

Which is a physical layer standard for serial communications between two or more devices?

Available Choices (select all choices that are correct)

- A. RS432
- B. RS435
- C. RS232
- D. RS235

Answer: B

NEW QUESTION # 200

Which of the following is NOT listed as a potential consequence of compromising IACS according to the ISA99 Committee scope?

- A. Economic and operational losses
- B. Loss of proprietary information
- C. Endangerment of public safety
- D. Increased product sales

Answer: D

Explanation:

The ISA99 Committee (which develops the ISA/IEC 62443 series) clearly outlines four key consequences of compromising an Industrial Automation and Control System (IACS):

Endangerment of public or employee safety

Loss of public confidence

Violation of regulatory requirements

Loss of proprietary or confidential information

Economic and operational losses

"Increased product sales" is not listed - in fact, a compromise would likely result in the opposite, such as brand damage and loss of customer trust.

"The scope of the ISA99 Committee includes addressing risks such as the endangerment of public safety, loss of information, and economic harm arising from cyber incidents affecting IACS."
