WGU Managing Cloud Security (JY02) Sample Questions (Q185-Q190):

NEW QUESTION # 185

Which entity provides common directory services?

- A. Domain Name System
- B. Terminal Access Controller Access-Control System
- C. Lightweight Directory Access Protocol
- D. Remote Authentication Dial-In User Service

Answer: C

Explanation:

Lightweight Directory Access Protocol (LDAP) provides common directory services. Managing Cloud principles explain that LDAP is used to store and retrieve information about users, groups, roles, and permissions in a centralized directory.

LDAP supports authentication, authorization, and identity management by enabling systems to query user attributes and access rights. It is widely used in enterprise and cloud environments to integrate applications with centralized identity services.

RADIUS and TACACS+ are authentication protocols, and DNS resolves domain names to IP addresses.

Therefore, LDAP is the correct entity for directory services.

NEW QUESTION # 186

Which data management activity is considered legal fair use of a copyrighted item?

- A. Performing the work publicly
- B. Broadcasting the work
- C. Reporting the work on the news
- D. Exporting the work

Answer: C

Explanation:

Reporting the work on the news is considered legal fair use of a copyrighted item. Managing Cloud guidance explains that fair use allows limited use of copyrighted material without permission when the purpose is commentary, criticism, education, or news reporting.

In news reporting, copyrighted material may be referenced or partially reproduced to inform the public, provided it does not replace the original work or cause financial harm to the copyright owner. This principle supports transparency and public awareness while balancing intellectual property rights.

The other activities typically require authorization from the copyright holder. Performing a work publicly, exporting it, or broadcasting it generally involves distribution or commercial use, which falls outside fair use protections. Therefore, reporting the work in the news is the correct example of legal fair use.

NEW QUESTION # 187

A user creates new financial documents that will be stored in the cloud. Which action should the user take before uploading the documents to protect them against threats such as packet capture and on-path attacks?

- A. Metadata labeling
- B. Encryption
- C. Hashing
- D. Change tracking

Answer: B

Explanation:

Before transmitting sensitive financial data to the cloud, the best defense against interception threats like packet capture and man-in-the-middle attacks is encryption. Encryption protects data in transit by converting plain text into cipher text, which can only be deciphered with the correct keys.

Hashing provides integrity verification but does not secure confidentiality. Change tracking monitors modifications but does not prevent interception. Metadata labeling adds context but does not protect against on-path attackers.

Using strong encryption protocols (e.g., TLS) ensures that even if traffic is intercepted, the attacker cannot read the data. Encryption also aligns with compliance requirements such as PCI DSS, which mandates encryption for financial data during transmission. By encrypting before upload, the user ensures end-to-end confidentiality across potentially insecure networks.

NEW QUESTION # 188

Which technology is increasingly deployed in enterprise environments for applications such as digital tracking of the supply chain?

- A. Internet of Things
- B. Machine learning
- C. Cloud computing
- D. Big data

Answer: A

Explanation:

The Internet of Things (IoT) is increasingly deployed in enterprise environments for digital tracking of supply chains. Managing Cloud principles explain that IoT enables physical objects—such as sensors, tags, and devices—to collect and transmit data in real time.

In supply chain scenarios, IoT devices track location, temperature, humidity, and movement of goods throughout manufacturing, transportation, and storage. This continuous data collection improves visibility, efficiency, and accountability across the supply chain. Cloud platforms commonly support IoT by aggregating, storing, and analyzing the collected data.

Cloud computing provides infrastructure, big data analyzes large datasets, and machine learning derives insights, but IoT is the enabling technology that performs real-time tracking. Therefore, Internet of Things is the correct answer.

NEW QUESTION # 189

A group of DevOps engineers adopted the network-as-code methodology to manage network infrastructure.

During a code release, the engineers find a bug that is causing issues on a production site. Which safeguard will allow the engineers to restore functionality to the production site?

- A. Rollback
- B. Staging
- C. Code review
- D. Code testing

Answer: A

Explanation:

Rollback is the safeguard that restores a system to its previous, stable state when a new code release introduces issues. In DevOps workflows, rollbacks provide a rapid recovery mechanism, reducing downtime and minimizing customer impact.

Staging, code review, and testing are preventive controls that reduce the likelihood of defects reaching production, but once a bug has already been deployed, rollback is the corrective control.

Rollback strategies often rely on version control systems, container orchestration, or infrastructure-as-code automation to quickly revert to earlier configurations. This practice is essential for maintaining reliability and availability, especially in cloud environments with continuous deployment pipelines.
