Exam Web-Development-Applications Objectives & Web-Development-Applications Exam Voucher

If you want a relevant and precise content that imparts you the most updated, relevant and practical knowledge on all the key topics of the Web-Development-Applications Certification Exam, no other Web-Development-Applications study material meets these demands so perfectly as does ExamBoosts's study guides. The Web-Development-Applications questions and answers in these guides have been prepared by the best professionals who have deep exposure of the certification exams and the exam takers needs. The result is that ExamBoosts's study guides are liked by so many ambitious professionals who give them first priority for their exams. The astonishing success rate of ExamBoosts's clients is enough to prove the quality and benefit of the study questions of ExamBoosts.

WGU Web Development Applications Sample Questions (Q102-Q107):

NEW QUESTION # 102

Which line of code creates a field that is displayed as a text box with up-and-down arrows and accepts a numeric value of less than 100?

- A. `<input type="range" name="experience" max="100">`
- B. `<input type="number" name="experience" maxlength="100">`
- C. `<input type="range" name="experience" maxlength="100">`
- D. `<input type="number" name="experience" max="100">`

Answer: D

Explanation:

> "`<input type="number">`" renders a numeric text box with spinner (up/down arrows). The `max="100"` attribute sets the upper limit for the value that can be entered." Example:

```
```html
<input type="number" max="100">
```
```

> `maxlength` only limits string length, not numeric value.

References:

- * MDN Web Docs: `<input type="number">`
- * HTML Specification: number input constraints

NEW QUESTION # 103

A JavaScript programmer defines the following function:

```
function square(number) {
  return number * number;
}
```

What is the name of the function?

- A. Return
- B. Function
- C. Number
- D. square

Answer: D

Explanation:

In JavaScript, the name of a function is defined after the `function` keyword and before the parentheses that enclose its parameters.

* Function Name: The function name is the identifier used to call the function. It is defined immediately after the `function` keyword.

* Usage Example:

```
function square(number) {
  return number * number;
}
```

In this example, the name of the function is `square`.

NEW QUESTION # 104

What is the purpose of cascading style sheets (CSSs)?

- A. Providing functionality that was previously provided by plug-ins
- B. Changing the content of a web page dynamically
- C. Setting rules to define how page content looks when rendered
- D. Structuring and describing web page content

Answer: C

Explanation:

Cascading Style Sheets (CSS) are used to control the presentation of web pages, including aspects such as layout, colors, fonts, and other visual styles. They are a cornerstone technology of the World Wide Web, along with HTML and JavaScript. Here's a detailed breakdown:

* Purpose of CSS: CSS is designed to enable the separation of document content (written in HTML or a similar markup language) from document presentation, including elements such as the layout, colors, and fonts. This separation can improve content accessibility, provide more flexibility and control in the specification of presentation characteristics, enable multiple web pages to share formatting, and reduce complexity and repetition in the structural content.

* Setting Visual Rules: CSS allows developers to define rules that specify how different elements of a web page should be displayed. For example, CSS rules can change text color, font size, spacing between elements, and even the overall layout of the web page. These rules are applied by the browser to render the web page according to the defined styles.

* Cascading Nature: The term "cascading" in CSS refers to the process of combining multiple style sheets and resolving conflicts between different CSS rules. This allows developers to use different sources of style information, which can be combined in a hierarchical manner. For instance, a browser style sheet, an external style sheet, and inline styles can all contribute to the final rendering of a web page.

* Benefits of CSS:

* Consistency: By using CSS, developers can ensure a consistent look and feel across multiple web pages.

* Maintainability: CSS makes it easier to update the visual presentation of a web page without altering the HTML structure. This is particularly useful for maintaining large websites.

* Reusability: CSS rules can be reused across multiple pages, reducing redundancy and making it easier to implement changes globally.

* Examples of CSS:

css

Copy code

```
body {  
background-color: lightblue;  
}  
h1 {  
color: navy;  
margin-left: 20px;  
}
```

In this example, the `body` element is given a light blue background color, and the `h1` element is styled with a navy color and a left margin of 20 pixels.

NEW QUESTION # 105

What should a developer increase to create space between a border and content?

- A. Margin
- B. Height
- C. Width
- D. Padding

Answer: D

Explanation:

Padding is the CSS property used to create space between the content of an element and its border. It is an internal spacing within the element.

- * CSS Box Model:
 - * Content: The innermost part, where text and images appear.
 - * Padding: The space between the content and the border.
 - * Border: The edge of the element.
 - * Margin: The space outside the border, creating space between different elements.
 - * Usage:
 - * Padding:
- ```
div {
padding: 20px;
}
```
- \* This code adds 20 pixels of padding on all sides of the content within the div element.

  - \* MDN Web Docs - Padding
  - \* W3C CSS Box Model

### NEW QUESTION # 106

A web page has a section that contains an <article> element. The element is always 10 pixels to the right of its position. Which type of layout positioning should the <article> element use?

- A. Absolute
- **B. Relative**
- C. Fixed
- D. Static

**Answer: B**

Explanation:

Relative positioning in CSS positions an element relative to its normal position. Using position: relative; allows you to adjust the element's position with the top, right, bottom, or left properties.

\* CSS Relative Positioning:

\* Syntax:

```
article {
position: relative;
left: 10px;
}
```

\* Description: Moves the element 10 pixels to the right from its normal position.

\* Example:

\* Given HTML:

```
<article>Content</article>
```

\* Given CSS:

```
article {
position: relative;
left: 10px;
}
```

\* Explanation: The <article> element will be positioned 10 pixels to the right of where it would normally appear.

\* References:

\* MDN Web Docs - position
