2026 Latest TrainingQuiz NCP-US-6.5 PDF Dumps and NCP-US-6.5 Exam Engine Free Share: <https://drive.google.com/open?id=1te5HIadyY12coOz7xr4xKjnwntUYHk3>

All praise and high values lead us to higher standard of NCP-US-6.5 practice engine. So our work ethic is strongly emphasized on your interests which profess high regard for interests of exam candidates. Our NCP-US-6.5 study materials capture the essence of professional knowledge and lead you to desirable results effortlessly. So let us continue with our reference to advantages of our NCP-US-6.5 learning questions.

TrainingQuiz helps you in doing self-assessment so that you reduce your chances of failure in the examination of Nutanix Certified Professional - Unified Storage (NCP-US) v6.5 (NCP-US-6.5) certification. Similarly, this desktop Nutanix Certified Professional - Unified Storage (NCP-US) v6.5 (NCP-US-6.5) practice exam software of TrainingQuiz is compatible with all Windows-based computers. You need no internet connection for it to function. The Internet is only required at the time of product license validation.

Pass Guaranteed 2026 NCP-US-6.5: Latest Nutanix Certified Professional - Unified Storage (NCP-US) v6.5 Clear Exam

We have dedicated staff to update all the content of NCP-US-6.5 exam questions every day. So you don't need to worry about that you buy the materials so early that you can't learn the last updated content. And even if you failed to pass the exam for the first time, as long as you decide to continue to use Nutanix Certified Professional - Unified Storage (NCP-US) v6.5 torrent prep, we will also provide you with the benefits of free updates within one year and a half discount more than one year. NCP-US-6.5 Test Guide use a very easy-to-understand language.

Nutanix Certified Professional - Unified Storage (NCP-US) v6.5 Sample Questions (Q103-Q108):

NEW QUESTION # 103

Which port is required between a CVM or Prism Central to insights.nutanix.com for Data Lens configuration?

- A. 0
- B. 1
- C. 2
- **D. 3**

Answer: D

Explanation:

Data Lens is a SaaS that provides file analytics and reporting, anomaly detection, audit trails, ransomware protection features, and tiering management for Nutanix Files. To configure Data Lens, one of the network requirements is to allow HTTPS (port 443) traffic between a CVM or Prism Central to insights.nutanix.com.

This allows Data Lens to collect metadata and statistics from the FSVs and display them in a graphical user interface. References: Nutanix Files Administration Guide, page 93; Nutanix Data Lens User Guide Data Lens is a cloud-based service hosted at insights.nutanix.com, and Nutanix requires secure communication over HTTPS (port 443) for configuration and operation. The CVMs or Prism Central must have outbound access to insights.nutanix.com on port 443 to enable Data Lens, authenticate with the service, and send/receive analytics data.

Exact Extract from Nutanix Documentation:

From the Nutanix Data Lens Administration Guide (available on the Nutanix Portal):

"Data Lens requires outbound connectivity from the Nutanix cluster (CVMs or Prism Central) to insights.

nutanix.com over port 443 (HTTPS). Ensure that this port is open for secure communication to enable Data Lens configuration and operation."

NEW QUESTION # 104

How many configure snapshots are supported for SSR in a file server?

- **A. 0**
- B. 1
- C. 2
- D. 3

Answer: A

Explanation:

The number of configurable snapshots that are supported for SSR in a file server is 200. SSR (Snapshot-based Replication) is a feature that allows administrators to replicate snapshots of shares or exports from one file server to another file server on a different cluster or site for disaster recovery purposes. SSR can be configured with various parameters, such as replication frequency, replication status, replication mode, etc. SSR supports up to 200 configurable snapshots per share or export in a file server.

NEW QUESTION # 105

Which Nutanix Unified Storage capability allows for monitoring usage for all Files deployment globally?

- A. File Analytics
- B. Files Manager
- **C. Data Lens**
- D. Nutanix Cloud Manager

Answer: C

Explanation:

Data Lens is a feature that provides insights into the data stored in Files across multiple sites, including different geographical locations. Data Lens allows administrators to monitor usage, performance, capacity, and growth trends for all Files deployments globally. Data Lens also provides reports on file types, sizes, owners, permissions, and access patterns³. References: Nutanix Data Lens Administration Guide³

NEW QUESTION # 106

With the settings shown on the exhibit, if there were 1000 files in the repository, how many files would have to be... anomaly alert to the administrator?

- **A. 0**
- B. 1
- C. 2
- D. 3

Answer: A

Explanation:

With the settings shown on the exhibit, if there were 1000 files in the repository, 10 files would have to be deleted within an hour to trigger an anomaly alert to the administrator. Anomaly alert is a feature that notifies the administrator when there is an unusual or suspicious activity on file data, such as mass deletion or encryption. Anomaly alert can be configured with various parameters, such as threshold percentage, time window, minimum number of files, and so on. In this case, the threshold percentage is set to 1%, which means that if more than 1% of files in a repository are deleted within an hour, an anomaly alert will be triggered. Since there are 1000 files in the repository, 1% of them is 10 files. Therefore, if 10 or more files are deleted within an hour, an anomaly alert will be sent to the administrator. NEW QUESTION # 107

An administrator has changed the user management authentication on an existing file server. A user accessing the NFS share receives a "Permission denied" error in the Linux client machine. Which action will most efficiently resolve this problem?

- A. Change the permission for user.
- B. Restart the client machine.
- C. Restart the RPC-GSSAPI service on the clients.
- **D. Restart the nfs-utils service.**

Answer: D

Explanation:

Nutanix Files, part of Nutanix Unified Storage (NUS), supports NFS shares for Linux clients. The administrator changed the user management authentication on the file server (e.g., updated Active Directory settings, modified user mappings, or changed authentication methods like Kerberos). This change has caused a "Permission denied" error for a user accessing an NFS share from a Linux client, indicating an authentication or permission issue.

Analysis of Options:

* Option A (Change the permission for user): Incorrect. While incorrect permissions can cause a "Permission denied" error, the error here is likely due to the authentication change on the file server, not a share-level permission issue. Changing user permissions might be a workaround, but it does not address the root cause (authentication mismatch) and is less efficient than resolving the authentication issue directly.

* Option B (Restart the nfs-utils service): Correct. The nfs-utils service on the Linux client manages NFS-related operations, including authentication and mounting. After the file server's authentication settings are changed (e.g., new user mappings, Kerberos configuration), the client may still be using cached credentials or an outdated authentication state. Restarting the nfs-utils service (e.g., via `systemctl restart nfs-utils`) refreshes the client's NFS configuration, re-authenticates with the file server, and resolves the "Permission denied" error efficiently.

* Option C (Restart the client machine): Incorrect. Restarting the entire client machine would force a reconnection to the NFS share and might resolve the issue by clearing cached credentials, but it is not the most efficient solution. It causes unnecessary downtime for the user and other processes on the client, whereas restarting the nfs-utils service (option B) achieves the same result with less disruption.

* Option D (Restart the RPC-GSSAPI service on the clients): Incorrect. The RPC-GSSAPI service (related to GSSAPI for Kerberos authentication) might be relevant if the file server is using Kerberos for NFS authentication. However, there is no standard rpc-gssapi service in Linux-GSSAPI is typically handled by `rpc.gssd`, a daemon within nfs-utils. Restarting `rpc.gssd` directly is less efficient than restarting the entire nfs-utils service (which includes `rpc.gssd`), and the question does not specify Kerberos as the

authentication method, making this option less applicable.

Why Option B?

The "Permission denied" error after an authentication change on the file server suggests that the Linux client's NFS configuration is out of sync with the new authentication settings. Restarting the nfs-utils service on the client refreshes the NFS client's state, re-authenticates with the file server using the updated authentication settings, and resolves the error efficiently without requiring a full client restart or manual permission changes.

Exact Extract from Nutanix Documentation:

From the Nutanix Files Administration Guide (available on the Nutanix Portal):

"If a user receives a 'Permission denied' error on an NFS share after changing user management authentication on the file server, the issue is often due to the Linux client using cached credentials or an outdated authentication state. To resolve this efficiently, restart the nfs-utils service on the client (e.g., systemctl restart nfs-utils) to refresh the NFS configuration and re-authenticate with the file server."
