Unsere Schulungsunterlagen zur EXIN CITM Zertifizierungsprüfung sind das Ergebnis der langjährigen ständigen Untersuchung und Erforschung von den erfahrenen IT-Experten aus EchteFrage. Ihre Autorität ist über jeden Zweifel erhaben. Wenn Sie noch Befürchtungen haben, können Sie die kostenlose Demo herunterladen, dann entscheiden Sie sich, ob Sie EchteFrage wählen.

EXIN EPI Certified Information Technology Manager CITM Prüfungsfragen mit Lösungen (Q41-Q46):

41. Frage

Whilst creating the IT service catalog, a needs analysis is conducted. One of the items discussed is the data points required for the IT services. What is the objective of these data points?

- A. To determine the life expectancy of IT services
- **B. To measure the performance of IT services delivered**
- C. To identify the data being used by the customer
- D. To establish the operating hours of the IT services

Antwort: B

Begründung:

In ITIL's service catalog management, data points required for IT services are used to measure the performance of IT services delivered (A). These data points (e.g., uptime, response times, incident resolution rates) enable the IT provider to monitor and report on service quality, ensuring alignment with service level agreements (SLAs) and customer expectations. A needs analysis identifies key performance indicators (KPIs) to track service effectiveness.

* Identify data used by the customer (B): Focuses on customer data usage, not service performance.

* Determine life expectancy (C): Relates to service lifecycle planning, not data points.

* Establish operating hours (D): Operating hours are a service attribute, not the primary purpose of data points.

Reference: EPI CITM study guide, under Service Management, likely references ITIL's service catalog management, emphasizing KPIs for performance measurement. Check sections on service catalog or performance metrics.

42. Frage

What is the correct sequence of activities for a risk assessment?

- A. Monitor and review - establish context - identify - evaluate - treatment
- B. Communication - establish context - analyse - treatment - monitor and review
- C. Identify - analyse - evaluate - treatment - monitor and review
- **D. Establish context - identify - analyse - evaluate - treatment**

Antwort: D

Begründung:

The correct sequence for risk assessment, as per ISO 31000 and ISO/IEC 27001, is: Establish context - identify - analyse - evaluate - treatment (C).

* Establish context: Define the scope, objectives, and criteria for the risk assessment (e.g., organizational goals, assets, and risk appetite).

* Identify: Identify potential risks (e.g., threats and vulnerabilities) that could impact objectives.

* Analyse: Assess the likelihood and impact of identified risks to determine their severity.

* Evaluate: Compare risks against risk criteria to prioritize them for treatment.

* Treatment: Implement controls or strategies to mitigate, avoid, transfer, or accept risks.

* Option A: Incorrect, as "monitor and review" is a post-treatment step, not the starting point.

* Option B: Incorrect, as "communication" is not a distinct step in risk assessment; it's embedded throughout.

* Option D: Incorrect, as it skips "establish context," which is essential for defining the assessment's scope.

This sequence ensures a structured, systematic approach to risk assessment, aligning with organizational objectives.

Reference: EPI CITM study guide, under Risk Management, likely references ISO 31000 or ISO/IEC 27001 for risk assessment processes. Check sections on risk assessment methodologies or risk management lifecycle.

43. Frage

In vendor selection, what is the most important reason for a reference check?

- A. To verify products by other customers
- B. To obtain financial information for vendor negotiation
- C. To identify customers not mentioned on the reference list
- **D. To independently verify and validate a vendor's claim**

Antwort: D

Begründung:

The most important reason for a reference check in vendor selection is to independently verify and validate a vendor's claim (A).

Reference checks involve contacting the vendor's previous or current clients to confirm claims about performance, reliability, and service quality, ensuring the vendor can meet contractual obligations. This aligns with vendor management best practices to mitigate risks by validating vendor credibility.

* Verify products by other customers (B): Too narrow; reference checks focus on overall performance, not just products.

* Obtain financial information (C): Financial data is obtained through financial due diligence, not reference checks.

* Identify customers not mentioned (D): Not a primary goal; the focus is on validating provided references.

Reference: EPI CITM study guide, under Vendor Selection/Management, likely covers due diligence processes, emphasizing reference checks for validation. Check sections on vendor evaluation or due diligence.

44. Frage

In project management, what is the objective of a 'lessons learned' report?

- A. To inform the project owner with the overall achievement of the project's objectives
- B. To establish accountability for the mistakes being made in the project
- **C. Bringing forward positive and negative elements with the intent to benefit future projects**
- D. To identify all risks that occurred during the project

Antwort: C

Begründung:

A lessons learned report in project management is designed to document both positive and negative experiences from a project to improve future projects. According to the Project Management Institute (PMI) and frameworks like PMBOK, the purpose is to capture insights, successes, challenges, and recommendations to enhance processes, avoid repeating mistakes, and replicate successes in future initiatives.

Option A focuses only on reporting achievements, which is too narrow. Option B emphasizes accountability for mistakes, which is not the primary goal, as the report aims to improve rather than blame. Option C is incorrect because identifying risks is part of risk management, not the primary focus of lessons learned.

Option D correctly captures the intent to benefit future projects by analyzing both positive and negative aspects.

Reference: EPI CITM study guide, under Project Management, likely references PMBOK or similar frameworks, specifically the "Close Project or Phase" process, where lessons learned are documented. Check the section on project closure or knowledge management.

45. Frage

From the list below, which activity is not considered to be an activity in the software development phase?

- A. Code writing
- B. Testing
- C. Documenting
- **D. Implementation**

Antwort: D

Begründung:

In the Software Development Life Cycle (SDLC), the development phase typically includes code writing (A), testing (B), and documenting (C) to build and verify the software. Implementation (D) is part of the deployment phase, where the software is installed and made operational in the production environment, not part of development.

Reference: EPI CITM study guide, under Application Management, likely covers SDLC phases, distinguishing development from implementation. Refer to sections on software development or application lifecycle management.
