시험대비 Analytics-Arch-201최고덤프공부 덤프 최신 데모문제

Salesforce Analytics-Arch-201인증시험은 전문적인 관련지식을 테스트하는 인증시험입니다. KoreaDumps는 여러분이 Salesforce Analytics-Arch-201인증시험을 통과할 수 있도록 도와주는 사이트입니다. 많은 분들이 많은 시간과 돈을 들여 혹은 여러 학원 등을 다니면서Salesforce Analytics-Arch-201인증시험패스에 노력을 다합니다. 하지만 우리 KoreaDumps에서는 20시간 좌우만 투자하면 무조건Salesforce Analytics-Arch-201시험을 패스할 수 있도록 도와드립니다.

Salesforce Analytics-Arch-201 시험요강:

주제	소개

주제 1	• Deploy Tableau Server: This domain assesses the ability of Tableau Administrators to perform production-ready deployments of Tableau Server. It encompasses installing and configuring Tableau Server with external components, supporting air-gapped environments, disaster recovery validations, and blue-green deployments. It includes configuring and troubleshooting various authentication methods such as SAML, Kerberos, and LDAP. The section also covers implementing encryption strategies, installing and verifying Tableau Server on Linux and Windows platforms, resolving installation and configuration issues, and managing service accounts and logging.
주제 2	• Monitor and Maintain a Tableau Deployment: This section evaluates skills of Tableau Administrators in monitoring, maintaining, and optimizing Tableau environments. It involves creating custom administrative dashboards, conducting load testing using tools like TabJolt, and analyzing test results. Troubleshooting complex performance bottlenecks in workbooks and server resources is key, as is tuning caching and scaling strategies. It covers leveraging observability tools such as the Resource Monitoring Tool, analyzing logs and metrics, and adjusting architecture accordingly. Automation of maintenance functions using APIs, scripting, and scheduling is included, along with managing server extensions, content automation, dashboard extensions, web data connectors, and secure embedded solutions.
주제 3	• Design a Tableau Infrastructure: This section of the exam measures skills of Tableau Consultants and focuses on planning and designing a complex Tableau deployment. It covers gathering user requirements, licensing strategies including Authorization-to-Run, high availability and disaster recovery planning, and mapping server add-ons to the organization's needs. It includes planning and implementing Tableau Cloud with Bridge, authentication, user provisioning, and multi-site configuration. Additionally, it addresses migration planning across Tableau products, operating systems, identity stores, and consolidations, as well as designing process topologies, sizing, node roles, and recommending server configurations including security, hardware, and disaster recovery.

최신 Architect Exams Analytics-Arch-201 무료 샘플문제 (Q114-Q119):

질문 # 114

If you encounter an error related to dependency resolution while installing Tableau Server on Linux, what should be your initial troubleshooting step?

- A. Verifying that all required dependencies are installed and up-to-date on the Linux system
- B. Temporarily disabling the firewall and antivirus software on the Linux server
- C. Configuring the network settings to allow unrestricted internet access to the Linux server
- D. Changing the Linux server's hostname to ensure it's correctly recognized by Tableau Server

정답: A

설명:

Verifying that all required dependencies are installed and up-to-date on the Linux system When facing a dependency resolution error during the installation of Tableau Server on Linux, the first step should be to verify that all necessary dependencies are installed and up-to-date. Dependency issues often arise from missing or outdated packages, and ensuring that the system meets all pre-installation requirements is key to resolving these issues. Option A is incorrect because disabling firewall and antivirus software does not typically address dependency resolution problems. Option C is incorrect as configuring network settings for unrestricted internet access is not a standard approach to resolving dependency issues. Option D is incorrect because changing the hostname of the server is unlikely to resolve dependency-related installation errors.

질문 # 115

In the process of setting up Service Principal Names (SPNs) for Kerberos authentication in Tableau Server, what is an essential step for ensuring proper configuration?

- A. Ensuring the Tableau Server service account has the appropriate SPNs set for the server's fully qualified domain name (FQDN)
- B. Assigning a dedicated IP address for each SPN used by Tableau Server
- C. Enabling SSL on Tableau Server to encrypt the SPN communication
- D. Configuring each user account in Tableau Server with its own unique SPN

정답: A

설명:

Ensuring the Tableau Server service account has the appropriate SPNs set for the server's fully qualified domain name (FQDN) Setting the correct SPNs for the Tableau Server service account is crucial for Kerberos authentication. SPNs should be associated with the service account running Tableau Server and must match the server's FQDN. This enables Kerberos to correctly identify and authenticate the server in a network, ensuring secure communication. Option A is incorrect because SPNs are set for the service account running the server, not for each individual user account in Tableau Server. Option C is incorrect as SPNs are not directly tied to IP addresses but to service accounts and the FQDN of the server. Option D is incorrect because while SSL encryption is important for security, it is not directly related to the configuration of SPNs for Kerberos authentication.

질문 # 116

During the installation of Tableau Server on Linux, what step must be taken to ensure a smooth installation process using either CLI or the Installation Wizard?

- A. Ensuring that the Linux server has a minimum of 16GB of RAM
- B. Running a pre-installation script to automatically configure all server dependencies
- **C. Creating a dedicated Tableau user account and group on the Linux system**
- D. Temporarily disabling the SELinux policy on the Linux server

정답: C

설명:

Creating a dedicated Tableau user account and group on the Linux system A critical step in the Tableau Server installation process on Linux is creating a dedicated Tableau user account and group. This account is used to run Tableau Server processes and helps in managing permissions and ensuring that Tableau Server operates securely and efficiently within the Linux environment. Option A is incorrect because while having sufficient RAM is important, the specific requirement may vary and is not a direct step in the installation process. Option B is incorrect as running a pre-installation script is not typically a standard step in the Tableau Server installation process. Option D is incorrect because disabling SELinux is not recommended for security reasons and is not a required step for the Tableau Server installation.

질문 # 117

A company is migrating its Tableau workbooks and data sources from one server to another. Which feature of the Tableau Content Migration Tool is most critical for this process?

- **A. The functionality to automatically update data source connections in the workbooks during migration**
- B. The option to manually migrate each workbook individually for better control
- C. The capability to only migrate the most recently accessed workbooks
- D. The ability to change the visual design of workbooks during the migration

정답: A

설명:

The functionality to automatically update data source connections in the work-books during migration Automatically updating data source connections is essential to ensure that workbooks function correctly after migration, maintaining data integrity and continuity. Option A is incorrect because changing the visual design is not the primary function of a migration tool. Option C is incorrect as manual migration of each workbook is time-consuming and prone to errors. Option D is incorrect because it's important to migrate all necessary workbooks, not just the most recently accessed ones.

질문 # 118

A corporation is migrating their Tableau Server from a local identity store to a cloud-based identity provider. What is the most critical step to ensure a smooth transition?

- A. Choosing a cloud-based identity provider without considering its compatibility with Tableau Server
- B. Migrating all user data in a single batch to the new identity provider
- C. Immediately discontinuing the local identity store before the migration
- **D. Conducting a phased migration and ensuring synchronization between the old and new identity stores**
