## Reliable 101-500 Test Labs - 101-500 Actual Exam Dumps

The money you have invested on updating yourself is worthwhile. The knowledge you have learned is priceless. You can obtain many useful skills on our 101-500 study guide, which is of great significance in your daily work. Never feel sorry to invest yourself. Our 101-500 Exam Materials deserve your choice. If you still cannot make decisions, you can try our free demo of the 101-500 training quiz.

## Lpi LPIC-1 Exam 101, Part 1 of 2, version 5.0 Sample Questions (Q151-Q156):

### NEW QUESTION # 151

Which of the following commands can be used to display the inode number of a given file?

- A. ln
- B. cp
- C. ls
- D. inode

Answer: C

### NEW QUESTION # 152

In the vi editor, what vi command will copy (but not paste) from the current line at the cursor and the following 16 lines (17 lines total)?

**Answer:**

Explanation:

Specify the correct vi command without spaces.

17yy

Explanation:

The vi editor is a text editor that operates in two modes: command mode and insert mode. In command mode, the user can enter commands to perform various operations on the text, such as copying, pasting, deleting, moving, searching, etc. In insert mode, the user can type text into the file. To switch from command mode to insert mode, the user can press i, a, o, or other keys. To switch from insert mode to command mode, the user can press Esc. The yy command is used to copy (yank) the current line into a buffer. The number before the yy command specifies how many lines to copy, starting from the current line. Therefore, the command 17yy will copy the current line and the following 16 lines (17 lines total) into a buffer. The buffer can then be pasted into another location by using the p or P command. Note that the command 17yy does not paste the copied lines, it only copies them. References:

### NEW QUESTION # 153

Regarding the command:

```
nice -5 /usr/bin/prog
```

Which of the following statements is correct?

- A. /usr/bin/prog is executed with a priority of -5.
- B. /usr/bin/prog is executed with a nice level of -5.
- C. /usr/bin/prog is executed with a priority of 5.
- **D. /usr/bin/prog is executed with a nice level of 5.**

**Answer: D**

Explanation:

The nice command is used to start a process with a modified scheduling priority. The scheduling priority is a value that determines how much CPU time a process will receive from the kernel. The lower the priority, the more CPU time a process will get. The priority is also known as the nice value, because a process with a high nice value is being nice to other processes by giving up CPU time. The nice value ranges from -20 to 19, with -20 being the highest priority and 19 being the lowest. By default, processes are started with a nice value of 0, which means normal priority.

The nice command takes an optional argument -n followed by a number, which specifies the increment or decrement of the nice value from the default value of 0. For example, the command:

```
nice -n 5 /usr/bin/prog
```

will start the /usr/bin/prog process with a nice value of 5, which means a lower priority than the default.

Similarly, the command:

```
nice -n -5 /usr/bin/prog
```

will start the /usr/bin/prog process with a nice value of -5, which means a higher priority than the default. If the -n argument is omitted, the nice command will assume a default increment of 10. For example, the command:

```
nice /usr/bin/prog
```

will start the /usr/bin/prog process with a nice value of 10, which means a very low priority. Note that only the root user can start a process with a negative nice value, as this requires special privileges.

Therefore, the command:

```
nice -5 /usr/bin/prog
```

is equivalent to:

```
nice -n -5 /usr/bin/prog
```

and will start the /usr/bin/prog process with a nice value of -5, which means a higher priority than the default.

This means that the correct answer is B. /usr/bin/prog is executed with a nice level of 5.
