- C. The division operator "/" accepts floating point input.
- D. Numeric function division( numerator, denominator, decimal places ) accepts decimal input.
- E. The division operator "/" accepts decimal input.

**Answer: A,B,D**

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

In ABAP SQL, the handling of arithmetic operations - especially division - is handled with care for data types and precision. Here's how each applies:

\* B. Numeric function `division(numerator, denominator, decimal places)` accepts decimal input. This is correct. The division function is designed for decimal-based calculations, where precision control is needed via the third parameter (number of decimal places). It supports packed numbers (DEC).

\* C. Numeric function `div(numerator, denominator)` expects only integer input. This is correct. The `div` function is an integer division operator, returning an integer result and only accepts integers as input types.

\* E. Numeric function `division(numerator, denominator, decimal places)` accepts floating point input. This is correct. In addition to decimals, `division()` can also work with floating point types (FLTP), enabling flexible division where decimals are not sufficient.

\* A. The division operator `/` accepts decimal input. This is incorrect in the context of ABAP SQL.

The `/` operator is not available as a built-in operator in Open SQL; arithmetic operations like this are not supported with native operators - only via functions.

\* D. The division operator `/` accepts floating point input. Again, this is incorrect, as `/` is not valid syntax in ABAP SQL queries. Only built-in functions like `div` or `division` are supported in the CDS/Open SQL layer.

Reference: ABAP CDS Development Guide, section 2.2 - Built-in functions in ABAP SQL and CDS expressions for numerical calculations, specifically `division()` and `div()`.

- A. An alias can be assigned to the data sources and to the fields in the field list.
- B. The data sources are linked using an ON clause.
- C. The field list can include fields of the linked table without specifying the name of the corresponding data source.
- D. They can expose an entire data source without listing individual fields.
