### NEW QUESTION # 124

次のコードスニペットを検討してください:78

public class OpportunityHandler{
public static void setPricingStructure(Opportunity thisOpp){
Pricing_Structure__c ps = [Select Type__c FROM Pricing_Structure__c WHERE industry__c = :thisOpp.
Account_Industry__c];
thisOpp.Pricing_Structure__c = ps.Type__c;

}
```

このコードを最適化するには、開発者はどの2つのベストプラクティスを実装する必要がありますか？

- A. DML ステートメントにコレクションを使用します。
- B. DML ステートメントを削除します。
- C. ループの外で `Pricing_Structure__c` レコードを照会します。
- D. トリガー コンテキストを更新後、挿入後に変更します。

**Answer: B,C**

Explanation:

The provided code violates two fundamental Salesforce Apex best practices: bulkification and efficient use of trigger contexts. First, the code performs a SOQL query inside a loop (`setPricingStructure` is called inside the trigger's for loop). This is a critical performance issue because it consumes one SOQL query per record in the transaction. If 200 opportunities are updated at once, the code will hit the governor limit of 100 SOQL queries and throw an exception. To optimize this, the developer should use a Map or List to query all necessary `Pricing_Structure__c` records once, outside the loop (Option C), and then reference that collection during processing.

Second, the code is running in a before trigger context. In a before insert or before update trigger, any changes made directly to the records in `Trigger.new` are automatically saved to the database when the trigger completes without the need for an explicit DML update statement. Including an `update thisOpp;` statement (Option A) is not only redundant but dangerous, as it can trigger a recursive loop where the update re-fires the same trigger, leading to a "Maximum stack depth reached" error. By removing the DML statement and bulkifying the query, the code becomes more efficient, scalable, and compliant with platform governor limits.
