Our product is of high quality and boosts high passing rate and hit rate. Our passing rate is 98%-100% and our CTFL\_Syll\_4.0 test prep can guarantee that you can pass the exam easily and successfully. Our CTFL\_Syll\_4.0 exam materials are highly efficient and useful and can help you pass the exam in a short time and save your time and energy. It is worthy for you to buy our CTFL\_Syll\_4.0 Quiz torrent and you can trust our product. You needn't worry that our product can't help you pass the exam and waste your money. We guarantee to you our CTFL\_Syll\_4.0 exam materials can help you and you will have an extremely high possibility to pass the exam.

If you want to demonstrate your expertise in solving complex ISQI real-life problems, then you need to pass the ISQI CTFL\_Syll\_4.0 certification exam. However, passing this exam is not an easy task. It requires you to master complicated subjects related to ISTQB Certified Tester Foundation Level (CTFL) v4.0. To help you prepare for this exam, PDFTorrent offers verified ISQI CTFL\_Syll\_4.0 Exam Questions that are ruling the preparation world.

## Professional CTFL\_Syll\_4.0 Valid Study Guide, CTFL\_Syll\_4.0 Reliable Practice Questions

In fact, our CTFL\_Syll\_4.0 exam materials provide comprehensive customers service, and our commitment to users does not end at the point of sale. If you have any questions related to our CTFL\_Syll\_4.0 exam materials, you can always consult our customer service. Our customer service is 24 hours online and will answer your questions in the shortest possible time. Our CTFL\_Syll\_4.0 Exam Materials assure you that we will provide the best service before you pass the CTFL\_Syll\_4.0 exam. PDFTorrent will never disappoint you. Therefore, you can prepare real CTFL\_Syll\_4.0 exams using the actual CTFL\_Syll\_4.0 exam questions. This is indeed a huge opportunity. Don't miss it!

## ISQI ISTQB Certified Tester Foundation Level (CTFL) v4.0 Sample Questions (Q48-Q53):

### NEW QUESTION # 48

Which of the following statements is CORRECT about White-box testing?

- A. White-box testing helps find defects even when specifications are vague because it takes into account the code.
- **B. White-box testing helps find defects because they can be used to measure statement coverage**
- C. White-box testing helps find defects because it provides for requirements based coverage
- D. White-box testing helps find defects because it focuses on defects rather than failures

**Answer: B**

Explanation:

White-box testing, also known as structural testing, involves testing the internal structures or workings of an application, as opposed to its functionality (which is tested by black-box testing). The correct statement about white-box testing is that it helps find defects by measuring aspects such as statement coverage.

\* Statement Coverage: White-box testing techniques like statement coverage measure whether each statement in the code has been executed at least once. This helps ensure that all parts of the code are tested and can reveal defects in areas that might not be reached by black-box testing alone.

Other statements are less accurate in the context of white-box testing:

\* Specifications being vague: White-box testing is code-focused, not requirement-focused. If specifications are vague, it affects both white-box and black-box testing. The main advantage of white-box testing is that it allows testers to create tests based on the code's structure and logic.

\* Requirements-based coverage: This is typically associated with black-box testing, which derives tests from specifications and requirements. White-box testing, on the other hand, derives tests from the code itself.

\* Focus on defects rather than failures: Both white-box and black-box testing aim to identify defects, but white-box testing does this through code coverage and examining the code paths directly. It does not focus exclusively on defects rather than failures; it is just another method to identify potential issues.

#### NEW QUESTION # 49

Which of the following statements about static testing and dynamic testing is true?

- A. Static testing is usually much less cost-effective than dynamic testing
- B. Unlike dynamic testing, which focuses on detecting potential defects, static testing focuses on detecting failures which may be due to actual defects
- C. Unlike dynamic testing, which can be also performed manually, static testing cannot be performed without specialized tools
- **D. Both static testing and dynamic testing can be used to highlight issues associated with non-functional characteristics**

**Answer: D**

Explanation:

This answer is correct because static testing and dynamic testing are both types of testing that can be used to highlight issues associated with non-functional characteristics, such as usability, performance, security, reliability, etc. Static testing is a type of testing that involves the analysis of software work products, such as requirements, design, code, or test cases, without executing them.

Dynamic testing is a type of testing that involves the execution of software work products, such as code or test cases, using inputs and verifying outputs. Both static testing and dynamic testing can be applied to different test levels and test types, and can use different test techniques and tools, to evaluate the non-functional characteristics of the software product. #### NEW QUESTION # 50

Which ONE of the following options CORRECTLY describes one of the seven principles of the testing process?

- **A. It is impossible to test all possible combinations of inputs and preconditions of a system.**
- B. Automated testing enables exhaustive testing.
- C. The objective of testing is to implement exhaustive testing and execute as many test cases as possible.
- D. Exhaustive testing can only be carried out using behavior-based techniques.

**Answer: A**

Explanation:

Exhaustive testing (testing all input combinations) is practically impossible except in trivial cases (C). Instead, testers focus on risk-based, prioritized, and efficient test techniques. The seven principles of testing in the ISTQB syllabus highlight that exhaustive testing is infeasible, and therefore, techniques such as equivalence partitioning, boundary value analysis, and risk-based testing are used to optimize test coverage.

#### NEW QUESTION # 51

Which of the following issues cannot be identified by static analysis tools?

- A. Referencing a variable with an undefined value
- B. Potentially endless loops
- **C. Very low MTBF (Mean Time Between failure)**
- D. Security vulnerabilities

**Answer: C**

Explanation:

Static analysis tools are software tools that examine the source code of a program without executing it. They can detect various types of issues, such as syntax errors, coding standards violations, security vulnerabilities, and potential bugs<sup>12</sup>. However, static analysis tools cannot identify issues that depend on the runtime behavior or performance of the program, such as very low MTBF (Mean Time Between failure)<sup>3</sup>. MTBF is a measure of the reliability of a system or component. It is calculated by dividing the total operating time by the number of failures. MTBF reflects how often a system or component fails during its expected lifetime. Static analysis tools cannot measure MTBF because they do not run the program or observe its failures. MTBF can only be estimated by dynamic testing, which involves executing the program under various conditions and collecting data on its failures<sup>4</sup>. Therefore, very low MTBF is an issue that cannot be identified by static analysis tools. The other options, such as potentially endless loops, referencing a variable with an undefined value, and security vulnerabilities, are issues that can be identified by static analysis tools. Static analysis tools can detect potentially endless loops by analyzing the control flow and data flow of the program and checking for conditions that may never become false<sup>5</sup>. Static analysis tools can detect referencing a variable with an undefined value by checking the scope and initialization of variables and reporting any use of uninitialized variables<sup>6</sup>. Static analysis tools can detect security vulnerabilities by checking for common patterns of insecure code, such as buffer overflows, SQL injections, cross-site scripting, and weak encryption. #### NEW QUESTION # 52

Consider the following statements (I to V) about software testing:

- I. Can be applied to non-executable work products.
- II. Can be used to measure performance efficiency.
- III. Can lead to the detection of defects.
- IV. Can find defects directly.
- V. Can identify unexpected behaviors caused by potential defects.

Which ONE of the following options is the list that characterizes static tests the BEST?

- A. Statements II, IV, and V
- B. Statements II, III, and V
- C. Statements I, II, and IV
- **D. Statements I, III, and IV**

**Answer: D**

Explanation:

Static testing (A) applies to non-executable work products (I), such as requirements or code reviews. It also leads to defect detection (III) and finds defects directly (IV) without executing the software. Options B, C, and D incorrectly associate static testing with performance measurement (II) or dynamic testing aspects (V).
