Cisco Supporting Cisco Devices for Field Technicians Sample Questions (Q46-Q51):

NEW QUESTION # 46

Which two settings are standard Cisco console connections when configuring a terminal emulator to connect to the console port of a Cisco switch? (Choose two.)

- A. Data bits: 8
- B. Flow control: Hardware
- C. Speed (baud rate): 9600
- D. Parity: Even
- E. Stop bits: 2

Answer: A,C

Explanation:

When configuring a terminal emulator (such as PuTTY, Tera Term, or HyperTerminal) to connect to the console port of a Cisco switch, the standard settings are as follows:

Speed (baud rate): 9600

This is the default transmission speed for Cisco console ports, ensuring compatibility across various devices.

Data bits: 8

This setting specifies that each character transmitted consists of 8 data bits, which is standard for most serial communications.

Parity: None

No parity bit is used, meaning there is no additional error-checking bit appended to each character.

Stop bits: 1

One stop bit indicates the end of a character transmission.

Flow control: None

No flow control is employed, allowing continuous data transmission without hardware or software-based pausing.

Therefore, options C (Speed: 9600) and D (Data bits: 8) are correct. Options A (Stop bits: 2), B (Flow control: Hardware), and E (Parity: Even) deviate from the standard settings and may result in communication issues if configured.

NEW QUESTION # 47

Drag and drop the safety actions that must be taken prior to beginning work into order on the right for working with electrical equipment.

Answer:

Explanation:

Explanation:

In the FLDTEC course, under Safety and ESD Procedures, Cisco outlines the following safety workflow before working on any network hardware:

- * Locate Emergency Power-Off Switch: Identifying how to cut power quickly is essential in case of an electrical fault or emergency.
- * Disconnect Power: Always ensure the power source is turned off and disconnected before handling any components.
- * Verify with Multimeter: Use a multimeter to confirm that no voltage is present before proceeding.
- * Connect ESD Strap: Once confirmed safe, attach your ESD strap to a grounded point to prevent electrostatic damage to sensitive components.

Following this process is critical not only for personal safety but also for equipment protection, especially during hardware installation, maintenance, or RMA replacements.

NEW QUESTION # 48

What is the primary reason for placing heavier devices toward the bottom of the rack when installing replacement hardware?

- **A. To maintain rack stability**
- B. To facilitate easier cable management
- C. To improve air circulation
- D. To simplify device maintenance

Answer: A

Explanation:

The primary reason for placing heavier equipment, such as UPS units or core switches, at the bottom of a rack is to maintain stability. A lower center of gravity reduces the risk of tipping, especially when the rack is not yet bolted or braced.

This is a standard safety precaution in network hardware installation and is particularly important when racks are being serviced or relocated.

Reference: Supporting Cisco Devices for Field Technicians (FLDTEC) - Safety and ESD Precautions Explanation:

The primary reason for placing heavier devices toward the bottom of the rack is to maintain rack stability.

This helps ensure the rack remains balanced and prevents tipping, especially when multiple devices are installed.

NEW QUESTION # 49

Refer to the exhibit. Drag and drop the steps in the TCP/IP encapsulation process from the left onto the corresponding layer on the right.

Answer:

NEW QUESTION # 50

Which term describes the physical range of radio frequency coverage provided by an access point in a wireless topology?

- A. Wireless LAN Controller (WLC)
- B. Wireless LAN (WLAN)
- **C. Basic Service Area (BSA)**
- D. Service Set Identifier (SSID)

Answer: C

Explanation:

In wireless networking, the Basic Service Area (BSA) refers to the physical area of radio frequency coverage provided by an access

point (AP) in a Basic Service Set (BSS). The BSA defines the coverage area where wireless clients can connect to the network through the AP. The size and shape of a BSA depend on various factors, including the AP's transmit power, antenna type, and physical environment.

Option A, the Service Set Identifier (SSID), is the network name broadcast by the AP. Option C, Wireless LAN (WLAN), refers to the overall wireless network. Option D, Wireless LAN Controller (WLC), is a device that manages multiple APs in a network.
