Highlight a person's learning effect is not enough, because it is difficult to grasp the difficulty of testing, a person cannot be effective information feedback, in order to solve this problem, our Sitecore-XM-Cloud-Developer real exam materials provide a powerful platform for users, allow users to exchange of experience. Here, the all users of our Sitecore-XM-Cloud-Developer learning reference files can through own id to login to the platform, realize the exchange and sharing with other users, even on the platform and more users to become good friends, encourage each other, to deal with the difficulties encountered in the process of preparation each other. Our Sitecore-XM-Cloud-Developer learning reference files not only provide a single learning environment for users, but also create a learning atmosphere like home, where you can learn and communicate easily.

Our Sitecore-XM-Cloud-Developer study guide has three formats which can meet your different needs: PDF, software and online. If you choose the PDF version, you can download our study material and print it for studying everywhere. With our software version of Sitecore-XM-Cloud-Developer exam material, you can practice in an environment just like the real examination. And you will certainly be satisfied with our online version of our Sitecore-XM-Cloud-Developer training quiz. It is more convenient for you to study and practice anytime, anywhere.

Sitecore XM Cloud Developer Certification Exam Exam Questions Can Help You Gain Massive Knowledge of Sitecore-XM-Cloud-Developer Certification

Based on a return visit to students who purchased our Sitecore-XM-Cloud-Developer actual exam, we found that over 99% of the customers who purchased our Sitecore-XM-Cloud-Developer learning materials successfully passed the exam. Advertisements can be faked, but the scores of the students cannot be falsified. Sitecore-XM-Cloud-Developer Study Guide's good results are derived from the intensive research and efforts of our experts. And we have become a popular brand in this field.

Sitecore XM Cloud Developer Certification Exam Sample Questions (Q33-Q38):

NEW QUESTION # 33

To connect Sitecore Pages to your local XM Cloud instance, which steps are involved?

- A. Open the local Content Management instance and set the predefined rendering host field value in Sitecore to <https://xmcloudcm.localhost>
- B. Open the local Content Management instance and set the predefined rendering host field value in Sitecore to <https://pages.sitecorecloud.io>
- C. Open Pages and create an entry in Local Storage for the key "Sitecore.Pages.LocalXMCloudUrl" with the following value: <https://pages.sitecorecloud.io>
- D. Open Pages and create an entry in Local Storage for the key "Sitecore.Pages.LocalXMCloudUrl" with the following value: <https://xmcloudcm.localhost>

Answer: D

Explanation:

According to the Sitecore XM Cloud Documentation for Developers¹, after setting up your local XM Cloud development environment, Sitecore Pages is not connected to your locally running XM Cloud instance. You can connect your local XM Cloud application to Sitecore Pages by setting a local storage key in your browser.

This allows you to use Sitecore Pages to edit content and layouts on your local front-end application. To connect Sitecore Pages to your local XM Cloud instance, you need to follow these steps²:

In your browser, navigate to the Sitecore Pages application.

Open the developer tools console of your browser and find the local storage section. The location differs between browsers:

For Chrome and Edge, open the Application panel. In the Storage section, expand the Local Storage section.

For Firefox, open the Storage panel, and expand the Local Storage section.

In the Local Storage panel, click the entry for Sitecore Pages⁹ to reveal the local storage entries.

Create a new entry by adding a new row with the following values:

Key: Sitecore.Pages.LocalXMCloudUrl

Value: the URL of your local XM Cloud instance. For example, `10`.

Refresh the⁹page to see your local front-end application.

²:Connect Sitecore Pages to your local XM Cloud instance¹:XM Cloud Documentation for Developers - Sitecore

NEW QUESTION # 34

When deploying to XM Cloud, how are Sitecore Content Serialization (SCS) serialized items created in the Content Management (CM) instance?

- **A. The XM Cloud deploy process creates an Items as Resources (IAR) file and layers this into the CM instance.**
- B. A build pipeline must be created to use the SCS CLI push commands to push content after the XM Cloud Deploy app finishes.
- C. The XM Cloud deploy process uses serialized item batches through REST APIs at the XM Cloud CM to speed up serialization.
- D. The XM Cloud deploy process uses the SCS CLI to do a push once the CM instance is active.

Answer: A

Explanation:

In XM Cloud, Sitecore Content Serialization (SCS) is used to manage serialized items and synchronize them with the Content Management (CM) instance. Unlike traditional Sitecore deployments where items are manually pushed using SCS CLI, XM Cloud follows an automated approach using Items as Resources (IAR).

* During the Deployment Process:

* The XM Cloud Deploy process packages serialized content into an Items as Resources (IAR) file.

* This IAR file contains the serialized Sitecore items and is included in the deployment package.

* When the CM Instance Starts:

* The IAR file is automatically layered into the CM database, ensuring the content structure is synchronized without requiring manual SCS CLI commands.

* Benefits of the IAR Approach:

* Faster and More Reliable: Instead of pushing serialized items manually, the IAR file is pre-packaged and automatically applied.

* No Additional Build Steps Required: Unlike traditional deployments where a separate script or pipeline is needed to push items, XM Cloud handles this automatically.

* Ensures Content Integrity: Items in the IAR file are versioned and deployed consistently across environments.

How Sitecore Content Serialization (SCS) Works in XM Cloud Deployments:

Why Are the Other Options Incorrect? #A. The XM Cloud deploy process uses the SCS CLI to do a push once the CM instance is active.

* Incorrect, because XM Cloud does not rely on the SCS CLI for pushing items during deployment.

Instead, it packages the items into an IAR file, which is automatically applied.

#C. A build pipeline must be created to use the SCS CLI push commands to push content after the XM Cloud Deploy app finishes.

* Incorrect, because XM Cloud automatically deploys items via the IAR file. There is no need for a separate pipeline to push serialized content manually.

#D. The XM Cloud deploy process uses serialized item batches through REST APIs at the XM Cloud CM to speed up serialization.

* Incorrect, because Sitecore does not use REST APIs to push serialized items in XM Cloud deployments. Instead, the IAR mechanism ensures content is deployed efficiently.

NEW QUESTION # 35

A developer needs to clear the Experience Edge cache to resolve a publishing issue. How can that be done?

- **A. Use the Experience Edge Admin API to clear the cache for the tenant.**
- B. Submit a support ticket to restart the Experience Edge tenant.
- C. Use the Experience Edge Admin API to delete the content.
- D. Go to <https://sitecore/admin/cache.aspx> and clear the cache.

Answer: A

Explanation:

To clear the Experience Edge cache and resolve publishing issues, a developer can use the Experience Edge Admin API. This API provides a specific endpoint to clear the entire cache for a tenant, which is the recommended method for directly addressing cache-related problems without deleting content or restarting services.

References: The Sitecore XM Cloud documentation for developers provides information on the Admin API, including the `ClearCacheForTenant` endpoint, which is used to clear the cache¹. This action is part of the administration capabilities offered by the API to manage the Experience Edge service effectively².

NEW QUESTION # 36

A developer is using the Content Editor to set placeholder restrictions on a placeholder called headless-footer. Because these restrictions have been set on the placeholder settings within `/sitecore/Layout/Placeholder Settings`, which of the following statements is correct?

- A. The restrictions apply for all placeholders called headless-footer within a single site in the XM Cloud Content Management instance.
- B. The restrictions only apply for subsequently created versions of a placeholder called headless-footer.
- **C. The restrictions apply for all placeholders called headless-footer on every page of every site that is in the XM Cloud Content Management instance.**
- D. The restrictions only apply for a placeholder called headless-footer on a designated page.

Answer: C

Explanation:

According to the Sitecore XM Cloud Documentation for Developers¹, in the Content Editor, you can set placeholder restrictions for your layout placeholders. These restrictions are applied on all pages in the site. For example, if you add restrictions for a footer, these apply for all footers on every page of the site. In this way, you can control the content that content authors can place in layout placeholders. To add a placeholder setting for a site, you need to create a placeholder item in the `Layout/Placeholder Settings` folder and enter the placeholder key and the allowed components².

The other options are not correct:

* A. The restrictions apply for all placeholders called headless-footer within a single site in the XM Cloud Content Management instance. This option is too narrow, as the placeholder restrictions apply to all sites that use the same placeholder key, not just one site.

* C. The restrictions only apply for a placeholder called headless-footer on a designated page. This option is too specific, as the placeholder restrictions apply to all pages that use the same placeholder key, not just one page. However, you can create placeholder restrictions on specific pages in the Experience Editor, if you want to override the default settings³.

* D. The restrictions only apply for subsequently created versions of a placeholder called headless-footer.

This option is incorrect, as the placeholder restrictions apply to all versions of the placeholder, not just the new ones.

²: Set placeholder restrictions | Sitecore Documentation³: Set placeholder restrictions | Sitecore Documentation¹: XM Cloud Documentation for Developers - Sitecore

NEW QUESTION # 37

A developer wants to create a webhook that sends an HTTP request to a specified endpoint when the workflow moves to the

approved state. What type of webhook should they use?

- A. Validation action
- B. Submit handler
- **C. Submit action**
- D. Event handler

Answer: C

Explanation:

In Sitecore XM Cloud, a webhook submit action is used to send an HTTP request to a specified endpoint when an item changes workflow state or a workflow command runs. Therefore, for a developer wanting to create a webhook that triggers when the workflow moves to the approved state, a webhook submit action would be the appropriate choice.

References: This information is confirmed by the Sitecore XM Cloud documentation, which details the different types of webhooks available and their specific uses, including the webhook submit action for workflow state changes¹.

NEW QUESTION # 38

.....

We believe that every customer pays most attention to quality when he is shopping. Only high-quality goods can meet the needs of every customer better. And our Sitecore-XM-Cloud-Developer training quiz has such high quality, because its hit rate of test questions is extremely high. Perhaps you will find in the examination that a lot of questions you have seen many times in our Sitecore-XM-Cloud-Developer Real Exam. And you will find our Sitecore-XM-Cloud-Developer practice questions are so popular that a lot of our candidates have bought them.
