Exam Dumps C_ABAPD_2507 Demo - C_ABAPD_2507 Practice Test

our C_ABAPD_2507 exam questions beckon exam candidates around the world with our attractive characters. Our experts made significant contribution to their excellence. So we can say bluntly that our C_ABAPD_2507 simulating exam is the best. Our effort in building the content of our C_ABAPD_2507 Study Materials lead to the development of learning guide and strengthen their perfection. To add up your interests and simplify some difficult points, our experts try their best to design our study material and help you understand the learning guide better.

SAP C_ABAPD_2507 Exam Syllabus Topics:

Topic	Details

Topic 1	<ul style="list-style-type: none"> • ABAP SQL and Code Pushdown: This section of the exam measures skills of SAP ABAP Developers and covers the use of advanced SQL techniques within ABAP. It includes code pushdown strategies that leverage database-level processing to enhance application performance. Key areas include Open SQL enhancements and integrating logic closer to the database.
Topic 2	<ul style="list-style-type: none"> • SAP Clean Core Extensibility and ABAP Cloud: This section of the exam measures skills of SAP Application Programmers and covers the clean core principles and extensibility options within SAP BTP. It also includes cloud-native ABAP development practices, emphasizing the creation of upgrade-stable and maintainable extensions aligned with SAP's cloud strategy.
Topic 3	<ul style="list-style-type: none"> • Core ABAP Programming: This section of the exam measures skills of SAP Application Programmers and covers foundational ABAP programming knowledge. Topics include modularization techniques, internal tables, control structures, and classical report programming. Mastery of these concepts is essential for building efficient ABAP applications.

SAP Certified Associate - Back-End Developer - ABAP Cloud Sample Questions (Q76-Q81):

NEW QUESTION # 76

When you create an exception class, what does SAP recommend you do?
(Select 3 correct answers)

- **A. Inherit from `cx_static_check`, if you want a warning at design time that the exception will not be caught.**
- B. Inherit from `cx_no_check`, if you want to reuse messages from a system exception class.
- **C. Define corresponding public attributes, if you want to pass context-specific values to placeholders of a message.**
- D. Inherit from `cx_static_check`, if you want a warning at design time that the exception can never be raised.
- **E. Implement interface `if_t100_message`, if you want to reuse messages from a message class.**

Answer: A,C,E

Explanation:

Comprehensive and Detailed Explanation from Exact Extract:

- * A # Recommended to define attributes for message placeholders.
- * C # Inheriting from `cx_static_check` enforces compile-time checks to ensure exceptions are handled.
- * E # Implementing `if_t100_message` allows integration with message classes.
- * B # Misleading, design-time warning is about handling, not raising.
- * D # Not a recommended practice in ABAP Cloud (system classes are not extendable).

Study Guide Reference: ABAP Objects Guide - Defining Exception Classes.

NEW QUESTION # 77

The class `zcl_demo_class` is in a software component with the language version set to "Standard ABAP". The function module "ZF11" is in a software component with the language version set to "ABAP Cloud". Both the class and function module are customer created. Regarding line #6, which of the following is a valid statement?

- A. 'ZF1' can be called via a wrapper that itself has not been released for cloud development.
- B. 'ZF1' can be called whether it has been released or not for cloud development.
- **C. 'ZF1' can be called via a wrapper that itself has been released for cloud development.**
- D. 'ZF1' must be released for cloud development to be called.

Answer: C

Explanation:

The function module ZF1 is in a software component with the language version set to "ABAP Cloud". This means that it follows the ABAP Cloud Development Model, which requires the usage of public SAP APIs and extension points to access SAP functionality and data. These APIs and extension points are released by SAP and documented in the SAP API Business Hub1. Customer-created function modules are not part of the public SAP APIs and are not released for cloud development. Therefore, calling a function module directly from a class with the language version set to "Standard ABAP" is not allowed and will result in a syntax

error. However, there is a possible way to call a function module indirectly from a class with the language version set to "Standard ABAP":

Create a wrapper class or interface for the function module and release it for cloud development. A wrapper is a class or interface that encapsulates the function module and exposes its functionality through public methods or attributes. The wrapper must be created in a software component with the language version set to "ABAP Cloud" and must be marked as released for cloud development using the annotation `@EndUserText.label`. The wrapper can then be called from a class with the language version set to "Standard ABAP" using the public methods or attributes².

For example, the following code snippet shows how to create a wrapper class for the function module ZF1 and call it from the class `zcl_demo_class`:

```
@EndUserText.label: 'Wrapper for ZF1' CLASS zcl_wrapper_zf1 DEFINITION PUBLIC FINAL CREATE PUBLIC. PUBLIC SECTION. CLASS-METHODS: call_zf1 IMPORTING iv_a TYPE i iv_b TYPE i EXPORTING ev_result TYPE i. ENDCLASS.
```

```
CLASS zcl_wrapper_zf1 IMPLEMENTATION. METHOD call_zf1. CALL FUNCTION 'ZF1' EXPORTING a = iv_a b = iv_b IMPORTING result = ev_result. ENDMETHOD. ENDCLASS.
```

```
CLASS zcl_demo_class DEFINITION. METHODS: ml. ENDCLASS.
```

```
CLASS zcl_demo_class IMPLEMENTATION. METHOD ml. DATA(lv_result) = zcl_wrapper_zf1=>call_zf1( iv_a = 2 iv_b = 3 ). WRITE: / lv_result. ENDMETHOD. ENDCLASS.
```

The output of this code is:

5

NEW QUESTION # 78

Which of the following ABAP SQL statements are valid? Note: There are 2 correct answers to this question.

- A. `SELECT FROM /dmo/connection FIELDS r-i carrid, airpfrom u GROUP BY carrid, connid INTO TABLE @DATA(It_hits).`
- B. `SELECT FROM /dmo/connection FIELDS carrid O airpfrom, MAX(distance) AS dist_max, MIN(distance) AS dist_min GROUP BY carrid, airpfrom INTO TABLE @DATA(It_hits)`
- C. `SELECT FROM /dmo/connection FIELDS V D MAX(distance) AS dist_max MIN(distance) AS dist_min INTO TABLE @DATA(It_hits).`
- D. `SELECT FROM /dmo/connection FIELDS V O carrid, airpfrom, MAX(distance) AS dist_max, MIN(distance) AS dist_min INTO TABLE @DATA(It_hits)`

Answer: B,D

Explanation:

The following are the explanations for each ABAP SQL statement:

A: This statement is valid. It selects the fields `carrid`, `airpfrom`, and the aggregate functions `MAX(distance)` and `MIN(distance)` from the table `/dmo/connection`, and groups the results by `carrid` and `airpfrom`. The aggregate functions are aliased as `dist_max` and `dist_min`. The results are stored in an internal table named `It_hits`, which is created using the inline declaration operator `@DATA`.

B: This statement is valid. It is similar to statement A, except that it does not specify the `GROUP BY` clause. This means that the aggregate functions are applied to the entire table, and the results are stored in an internal table named `It_hits`, which is created using the inline declaration operator `@DATA`.

C: This statement is invalid. It selects the aggregate functions `MAX(distance)` and `MIN(distance)` from the table `/dmo/connection`, but it does not specify any grouping or non-aggregate fields. This is not allowed in ABAP SQL, as the `SELECT` list must contain at least one non-aggregate field or a `GROUP BY` clause. The statement will cause a syntax error.

D: This statement is invalid. It selects the fields `carrid` and `airpfrom` from the table `/dmo/connection`, and groups the results by `carrid` and `connid`. However, the field `connid` is not included in the `SELECT` list, which is not allowed in ABAP SQL, as the `GROUP BY` clause must contain only fields that are also in the `SELECT` list. The statement will cause a syntax error.

NEW QUESTION # 79

Given the following ABAP SQL statement excerpt from an ABAP program:

```
1 SELECT SINGLE  
2 FROM spfli  
3 WHERE carid 'LH' AND conid= '00400'  
4 INTO @DATA(wa).
```

...

You are given the following information:

1. The data source "spfli" on line #2 is an SAP HANA database table.

2. "spfli" will be a large table with over one million rows.
3. This program is the only one in the system that accesses the table.
4. This program will run rarely.

Based on this information, which off the following general settings should you set for the spfli database table? Note: There are 2 correct answers to this question.

- A. "Load Unit" to "Page Loadable"
- B. "Load Unit" to "Column Loadable"
- C. "Storage Type" to "Row Store"
- D. "Storage Type" to "Column Store"

Answer: B,D

NEW QUESTION # 80

In RESTful Application Programming, a business object contains which parts? Note: There are 2 correct answers to this question.

- A. Behaviour definition
- B. Process definition
- C. Authentication rules
- D. CDS view

Answer: A,D

NEW QUESTION # 81
