Pass Guaranteed Quiz 2026 Professional Salesforce Mule-Arch-201: Reliable Salesforce Certified MuleSoft Platform Architect Test Objectives

BTW, DOWNLOAD part of DumpTorrent Mule-Arch-201 dumps from Cloud Storage: https://drive.google.com/open?id=1aX0Pf2N07PMElEyGXlOp7ydI85YmDzec

The third and last format is the Salesforce Certified MuleSoft Platform Architect (Mule-Arch-201) desktop practice test software that can be used on Windows laptops and PCs. Students with laptops or computers can access the software and prepare for it efficiently. The Salesforce Certified MuleSoft Platform Architect (Mule-Arch-201) dumps of DumpTorrent have many premium features, one of which is practice exams (desktop and web-based).

In a year after your payment, we will inform you that when the Mule-Arch-201 exam guide should be updated and send you the latest version. Our company has established a long-term partnership with those who have purchased our Mule-Arch-201 exam questions. We have made all efforts to update our products in order to help you deal with any change, making you confidently take part in the Mule-Arch-201 exam. Every day they are on duty to check for updates of Mule-Arch-201 Study Materials for providing timely application. We also welcome the suggestions from our customers, as long as our clients propose rationally. We will adopt and consider it into the renovation of the Mule-Arch-201 exam guide. Anyway, after your payment, you can enjoy the one-year free update service with our guarantee.

>> Reliable Mule-Arch-201 Test Objectives <<

Valid Reliable Mule-Arch-201 Test Objectives & Pass Guaranteed Mule-Arch-201 Instant Download: Salesforce Certified MuleSoft Platform Architect

The pass rate of Mule-Arch-201 study materials are 98.95%, if you buy Mule-Arch-201 study material from us, we can ensure you pass the exam successfully. Besides you can get Mule-Arch-201 exam dumps in ten minutes after your payment. You can use the Mule-Arch-201 exam dumps freely, if you have any questions in the process of your learning, you can consult the service stuff, and they have the professional knowledge about Mule-Arch-201 Learning Materials, so don't hesitate to ask for help from them.

Salesforce Certified MuleSoft Platform Architect Sample Questions (Q147-Q152):

NEW QUESTION # 147
A retail company is using an Order API to accept new orders. The Order API uses a JMS queue to submit orders to a backend order management service. The normal load for orders is being handled using two (2) CloudHub workers, each configured with 0.2 vCore. The CPU load of each CloudHub worker normally runs well below 70%. However, several times during the year the Order API gets four times (4x) the average number of orders. This causes the CloudHub worker CPU load to exceed 90% and the order submission time to exceed 30 seconds. The cause, however, is NOT the backend order management service, which still responds fast enough to meet the response SLA for the Order API. What is the MOST resource-efficient way to configure the Mule

application's CloudHub deployment to help the company cope with this performance challenge?

- A. Use a vertical CloudHub autoscaling policy that triggers on CPU utilization greater than 70%
- B. Permanently increase the number of CloudHub workers by four times (4x) to eight (8) CloudHub workers
- C. Use a horizontal CloudHub autoscaling policy that triggers on CPU utilization greater than 70%
- D. Permanently increase the size of each of the two (2) CloudHub workers by at least four times (4x) to one (1) vCore

Answer: C

Explanation:
Correct Answe r: Use a horizontal CloudHub autoscaling policy that triggers on CPU utilization greater than 70%
****
The scenario in the question is very clearly stating that the usual traffic in the year is pretty well handled by the existing worker configuration with CPU running well below 70%. The problem occurs only "sometimes" occasionally when there is spike in the number of orders coming in.
So, based on above, We neither need to permanently increase the size of each worker nor need to permanently increase the number of workers. This is unnecessary as other than those "occasional" times the resources are idle and wasted.
We have two options left now. Either to use horizontal Cloudhub autoscaling policy to automatically increase the number of workers or to use vertical Cloudhub autoscaling policy to automatically increase the vCore size of each worker.
Here, we need to take two things into consideration:
1. CPU
2. Order Submission Rate to JMS Queue
>> From CPU perspective, both the options (horizontal and vertical scaling) solves the issue. Both helps to bring down the usage below 90%.
>> However, If we go with Vertical Scaling, then from Order Submission Rate perspective, as the application is still being load balanced with two workers only, there may not be much improvement in the incoming request processing rate and order submission rate to JMS queue. The throughput would be same as before. Only CPU utilization comes down.
>> But, if we go with Horizontal Scaling, it will spawn new workers and adds extra hand to increase the throughput as more workers are being load balanced now. This way we can address both CPU and Order Submission rate.
Hence, Horizontal CloudHub Autoscaling policy is the right and best answer.

NEW QUESTION # 148
Which three tools automate the deployment of Mule applications?
Choose 3 answers

- A. Platform APIs
- B. Runtime Manager
- C. Anypoint Platform CLI
- D. Mule Mayen plugin
- E. API Community Manager
- F. Anypoint Studio

Answer: A,B,C

Explanation:
MuleSoft offers various tools to automate the deployment of Mule applications, which can streamline deployment and management processes. Here's how each tool supports automated deployment:
Runtime Manager:
Anypoint Runtime Manager is MuleSoft's web-based interface that allows users to deploy, manage, and monitor applications directly. It provides deployment automation through its user-friendly interface.
Anypoint Platform CLI:
The Anypoint CLI enables scripting of deployment and management tasks, making it possible to automate deployments via command-line scripts. This tool is ideal for CI/CD pipelines as it integrates with automated processes.
Platform APIs:
MuleSoft's Platform APIs allow programmatic access to deployment functions, enabling integration with external automation tools and CI/CD systems. These APIs facilitate deployment through RESTful calls, which can be automated for continuous delivery.
of Incorrect Options:
Option D (Anypoint Studio) is primarily for development and does not support deployment automation.
Option E (Maven Plugin) can be used for building and deploying Mule applications but isn't classified as a platform tool for deployment.

Option F (API Community Manager) is unrelated to deployment and instead focuses on managing API communities.
Reference
For detailed steps on automating deployments with these tools, refer to MuleSoft documentation on Runtime Manager, CLI, and Platform APIs.

NEW QUESTION # 149
A company deploys Mule applications with default configurations through Runtime Manager to customer-hosted Mule runtimes. Each Mule application is an API implementation that exposes RESTful interfaces to API clients. The Mule runtimes are managed by the MuleSoft-hosted control plane. The payload is never used by any Logger components.
When an API client sends an HTTP request to a customer-hosted Mule application, which metadata or data (payload) is pushed to the MuleSoft-hosted control plane?

- A. Only the metadata
- B. The data and metadata
- C. Only the data
- D. No data

Answer: A

Explanation:
Understanding the Data Flow Between Mule Runtimes and Control Plane:
When Mule applications are deployed on customer-hosted Mule runtimes, the MuleSoft-hosted control plane (Anypoint Platform) can monitor and manage these applications. However, due to data privacy and security, the control plane only collects specific types of information.
Typically, only metadata about the request and response (such as headers, status codes, and timestamps) is sent to the MuleSoft-hosted control plane. The actual payload data is not transmitted unless explicitly configured, ensuring that sensitive data remains within the customer's network.
Evaluating the Options:
Option A (Only the data): This is incorrect because the payload data itself is not automatically sent to the control plane in default configurations.
Option B (No data): This is incorrect as well; while the payload is not sent, metadata is still collected and sent to the control plane.
Option C (The data and metadata): This option is incorrect because data (payload) is not transmitted to the control plane by default.
Option D (Correct Answer): Only the metadata is sent to the MuleSoft-hosted control plane by default, aligning with MuleSoft's design to prioritize security and data privacy for customer-hosted runtimes.
Conclusion:
Option D is the correct answer, as by default, only metadata is sent to the MuleSoft-hosted control plane, and not the payload. This configuration is designed to protect sensitive data from being exposed outside the customer's hosted environment.
For more details, refer to MuleSoft's documentation on telemetry data collected in customer-hosted Mule runtimes and the MuleSoft control plane.

NEW QUESTION # 150
What Mule application can have API policies applied by
Anypoint Platform to the endpoint exposed by that Mule application?
A) A Mule application that accepts requests over HTTP/1.x
B) A Mule application that accepts JSON requests over TCP but is NOT required to provide a response C) A Mute application that accepts JSON requests over WebSocket D) A Mule application that accepts gRPC requests over HTTP/2

- A. Option A
- B. Option D
- C. Option C
- D. Option B

Answer: A

Explanation:
Correct Answe r: Option A
****
>> Anypoint API Manager and API policies are applicable to all types of HTTP/1.x APIs.
>> They are not applicable to WebSocket APIs, HTTP/2 APIs and gRPC APIs

NEW QUESTION # 151
A customer wants to monitor and gain insights about the number of requests coming in a given time period as well as to measure key performance indicators (response times, CPU utilization, number of active APIs).
Which tool provides these data insights?

- A. APT Manager
- B. Functional Monitoring
- C. Runtime Alerts
- D. Anypoint Monitoring

Answer: D

Explanation:
Understanding Anypoint Monitoring and Its Capabilities:
Anypoint Monitoring provides comprehensive visibility into Mule applications, offering metrics and analytics such as request counts, response times, CPU utilization, memory usage, and other key performance indicators (KPIs). This tool is designed to help teams monitor API usage, troubleshoot issues, and optimize application performance.
Evaluating the Options:
Option A (Correct Answer): Anypoint Monitoring is the ideal tool for this requirement. It provides real-time insights into metrics such as the number of requests, response times, CPU utilization, and active API usage.
Option B (API Manager): API Manager focuses on API lifecycle management, including applying policies, managing contracts, and setting access controls. It does not provide performance monitoring or KPI tracking.
Option C (Runtime Alerts): Runtime Alerts can notify users of specific conditions, like high CPU usage, but they do not provide a full suite of metrics or insights over a given time period.
Option D (Functional Monitoring): Functional Monitoring focuses on functional testing of APIs rather than performance and usage metrics. It does not provide continuous KPI tracking.
Conclusion:
Option A is the correct answer. Anypoint Monitoring is the most suitable tool to track the specified metrics, providing detailed insights into API requests, response times, CPU usage, and active API counts.
For further details, refer to MuleSoft's Anypoint Monitoring documentation on configuring dashboards and tracking performance metrics.

NEW QUESTION # 152
.....

materials are your top choice, And we will give you the most professional suggeston on the Mule-Arch-201 practice prep with kind and considerate manner in 24/7 online.

You do not need to study day and night.
