TorrentValid also provides easy to use SPLK-2002 practice test brain dump preparation software for SPLK-2002. Moreover, after the date of purchase of the SPLK-2002 testing engine, you will receive free updates for 90 days. The SPLK-2002 dumps practice test software is easy to install and has a simple interface. The practice test software for SPLK-2002 Exam provides a real feel of an exam and allows you to test your skills for the exam. The SPLK-2002 software comes with multiple features including the self-assessment feature. You will get free updates for 90 days after the purchase date that will allow you to get latest and well-curated questions for the SPLK-2002 exam.

Many times getting a right method is important and more efficient than spending too much time and money in vain. Our TorrentValid team devote themselves to studying the best methods to help you pass SPLK-2002 exam certification. From the time when you decide whether to purchase our SPLK-2002 exam software or not, we have provided you with comprehensive guarantees, including free demo download before buying, payment guarantee in purchase process, one-year free update service after you purchased SPLK-2002 Exam software, and full refund guarantee of dump cost if you fail SPLK-2002 exam certification, which are all our promises to ensure customer interests.

Are you ready to prove your technical knowledge and expertise with the Splunk SPLK-2002 certification exam?

We would like to benefit our customers from different countries who decide to choose our SPLK-2002 study guide in the long run, so we cooperation with the leading experts in the field to renew and update our SPLK-2002 study materials. We can assure you that you will get the latest version of our SPLK-2002 Training Materials for free from our company in the whole year after payment. Do not miss the opportunity to buy the best SPLK-2002 preparation questions in the international market which will also help you to advance with the times.

Splunk Enterprise Certified Architect Sample Questions (Q25-Q30):

NEW QUESTION # 25

When Splunk indexes data in a non clustered environment, what kind of files does it create by default?

- **A. Rawdata and index files.**
- B. Index and .tsidx files.
- C. Compressed and .tsidx files.
- D. Compressed and meta data files.

Answer: A

NEW QUESTION # 26

Splunk Enterprise performs a cyclic redundancy check (CRC) against the first and last bytes to prevent the same file from being re-indexed if it is rotated or renamed. What is the number of bytes sampled by default?

- A. 0
- B. 1
- **C. 2**
- D. 3

Answer: C

Explanation:

Splunk Enterprise performs a CRC check against the first and last 256 bytes of a file by default, as stated in the inputs.conf specification. This is controlled by the initCrcLength parameter, which can be changed if needed. The CRC check helps Splunk Enterprise to avoid re-indexing the same file twice, even if it is renamed or rotated, as long as the content does not change. However, this also means that Splunk Enterprise might miss some files that have the same CRC but different content, especially if they have identical headers. To avoid this, the crcSalt parameter can be used to add some extra information to the CRC calculation, such as the full file path or a custom string. This ensures that each file has a unique CRC and is indexed by Splunk Enterprise. You can read more about crcSalt and initCrcLength in the How log file rotation is handled documentation.

NEW QUESTION # 27

When implementing KV Store Collections in a search head cluster, which of the following considerations is true?

- **A. The search head cluster captain is also the KV Store Primary when collection content changes.**
- B. The KV Store Collection will not allow for changes to content if there are more than 50 search heads in the cluster.
- C. Each search head in the cluster independently updates its KV store collection when collection content changes.
- D. The KV Store Primary coordinates with the search head cluster captain when collection content changes.

Answer: A

Explanation:

According to the Splunk documentation¹, in a search head cluster, the KV Store Primary is the same node as the search head cluster captain. The KV Store Primary is responsible for coordinating the replication of KV Store data across the cluster members. When any node receives a write request, the KV Store delegates the write to the KV Store Primary. The KV Store keeps the reads local, however. This ensures that the KV Store data is consistent and available across the cluster.

NEW QUESTION # 28

Configurations from the deployer are merged into which location on the search head cluster member?

- A. **SPLUNK_HOME/etc/apps/APP_HOME/local**
- B. SPLUNK_HOME/etc/apps/search/default
- C. SPLUNK_HOME/etc/apps/APP_HOME/default
- D. SPLUNK_HOME/etc/system/local

Answer: A

Explanation:

Configurations from the deployer are merged into the SPLUNK_HOME/etc/apps/APP_HOME/local directory on the search head cluster member. The deployer distributes apps and other configurations to the search head cluster members in the form of a configuration bundle. The configuration bundle contains the contents of the SPLUNK_HOME/etc/shcluster/apps directory on the deployer. When a search head cluster member receives the configuration bundle, it merges the contents of the bundle into its own SPLUNK_HOME

/etc/apps directory. The configurations in the local directory take precedence over the configurations in the default directory. The SPLUNK_HOME/etc/system/local directory is used for system-level configurations, not app-level configurations. The SPLUNK_HOME/etc/apps/search/default directory is used for the default configurations of the search app, not the configurations from the deployer.

NEW QUESTION # 29

(What is a recommended way to improve search performance?)

- A. Use the shortest query possible.
- B. Use non-streaming commands as early as possible.
- C. **Filter as much as possible in the initial search.**
- D. Leverage the not expression to limit returned results.

Answer: C

Explanation:

Splunk Enterprise Search Optimization documentation consistently emphasizes that filtering data as early as possible in the search pipeline is the most effective way to improve search performance. The base search (the part before the first pipe |) determines the volume of raw events Splunk retrieves from the indexers. Therefore, by applying restrictive conditions early—such as time ranges, indexed fields, and metadata filters—you can drastically reduce the number of events that need to be fetched and processed downstream.

The best practice is to use indexed field filters (e.g., index=security sourcetype=syslog host=server01) combined with search or where clauses at the start of the query. This minimizes unnecessary data movement between indexers and the search head, improving both search speed and system efficiency.

Using non-streaming commands early (Option C) can degrade performance because they require full result sets before producing output. Likewise, focusing solely on shortening queries (Option A) or excessive use of the not operator (Option D) does not guarantee efficiency, as both may still process large datasets.

Filtering early leverages Splunk's distributed search architecture to limit data at the indexer level, reducing processing load and network transfer.
