Before clients purchase our Certificate of Cloud Security Knowledge v5 (CCSKv5.0) test torrent they can download and try out our product freely to see if it is worthy to buy our product. You can visit the pages of our product on the website which provides the demo of our CCSK study torrent and you can see parts of the titles and the form of our software. On the pages of our CCSK study tool, you can see the version of the product, the updated time, the quantity of the questions and answers, the characteristics and merits of the product, the price of our product, the discounts to the client, the details and the guarantee of our CCSK study torrent, the methods to contact us, the evaluations of the client on our product, the related exams and other information about our Certificate of Cloud Security Knowledge v5 (CCSKv5.0) test torrent.

The CCSK Certification Exam is suitable for various IT professionals, such as IT managers, security architects, security consultants, and auditors. It is also beneficial for organizations that are planning to migrate their IT infrastructure to the cloud or are already using cloud services. Certificate of Cloud Security Knowledge v5 (CCSKv5.0) certification is particularly relevant for organizations that have to comply with regulatory requirements such as GDPR, HIPAA, or PCI DSS.

Get 1 year Free Updates with CCSK Exam Questions

ValidExam is growing faster and many people find that obtaining a certificate has outstanding advantage over other peer, especially for promotion or applying for a large company. ValidExam helps fresh people enter into this area and help experienced workers have good opportunities for further development. Thus our passing rate of best CCSK Study Guide materials is nearly highest in this area. That's why we grows rapidly recent years and soon become the pioneer in CCSK qualification certificate learning guide

providers. Our CCSK study guide will be your best choice to help you clear exam certainly.

The CCSK v4.0 exam covers a wide range of cloud security topics, including cloud architecture, data security, governance, compliance, and much more. CCSK exam is designed to test an individual's knowledge of cloud security best practices, as well as their ability to apply that knowledge in real-world scenarios. CCSK exam is a vendor-neutral certification, meaning that it is not tied to any specific cloud platform, technology, or vendor.

The CCSK Exam is based on the CSA's "Security Guidance for Critical Areas of Focus in Cloud Computing" and is updated regularly to reflect changes in the cloud security landscape. The latest version of the exam, CCSK v4.0, covers topics such as cloud architecture, data security, compliance, and risk management. CCSK exam consists of 60 multiple-choice questions that must be completed within 90 minutes.

Cloud Security Alliance Certificate of Cloud Security Knowledge v5 (CCSKv5.0) Sample Questions (Q171-Q176):

NEW QUESTION # 171

What is the primary purpose of the CSA Security, Trust, Assurance, and Risk (STAR) Registry?

- A. To manage data residency and localization requirements
- **B. To document security and privacy controls of cloud offerings**
- C. To certify cloud services for regulatory compliance
- D. To provide cloud service rate comparisons

Answer: B

Explanation:

The CSA STAR Registry provides transparency by listing security and privacy controls of CSPs, helping customers assess provider security. Reference: [CCSK Overview, STAR Registry]

NEW QUESTION # 172

In federated identity management, what role does the identity provider (IdP) play in relation to the relying party?

- **A. The IdP makes assertions to the relying party after building a trust relationship.**
- B. The IdP and relying party have no direct trust relationship.
- C. The relying party makes assertions to the IdP about user authorizations.
- D. The IdP relies on the relying party to authenticate and authorize users.

Answer: A

Explanation:

In federated identity management, the identity provider (IdP) is responsible for authenticating users and making assertions about their identity to the relying party (which could be a service or application that trusts the IdP). The IdP and the relying party establish a trust relationship in advance, which allows the IdP to assert that a user is authenticated, often in the form of security tokens or assertions like SAML or OpenID Connect.

The IdP that authenticates users and makes assertions, not the relying party. The relying party does not make assertions to the IdP; the relying party relies on assertions made by the IdP. The IdP and relying party do have a direct trust relationship in federated identity management.

NEW QUESTION # 173

Which of the following best describes the concept of Measured Service in cloud computing?

- A. Cloud systems offer elastic resources.
- B. Cloud systems provide usage reports upon request, based on manual reporting.
- **C. Cloud systems automatically monitor resource usage and provide billing based on actual consumption.**
- D. Cloud systems allocate a fixed immutable set of measured services to each customer.

Answer: C

Explanation:

The correct answer is D. Cloud systems automatically monitor resource usage and provide billing based on actual consumption. Measured Service is one of the essential characteristics of cloud computing as defined by the NIST (National Institute of Standards and Technology). It implies that cloud systems automatically control and optimize resource usage by leveraging a metering capability. This capability tracks and reports resource consumption (such as CPU, storage, or bandwidth), which is used for billing, monitoring, and planning.

Key Characteristics:

Automatic Monitoring: Cloud platforms continuously track resource usage without manual intervention.

Billing Based on Usage: Customers are billed based on the actual consumption of resources (pay-as-you-go model).

Transparency: Users can view detailed usage reports to understand their resource utilization and associated costs.

Resource Optimization: Providers use these metrics to optimize resource allocation and improve efficiency.

Why Other Options Are Incorrect:

A . Fixed immutable set of measured services: This contradicts the concept of elasticity and resource pooling in cloud computing.

B . Elastic resources: While elasticity is a cloud characteristic, it does not directly define measured service.

C . Manual reporting: Measured service is about automated, real-time monitoring and billing, not manual data gathering.

Real-World Example:

In AWS, services like Amazon CloudWatch automatically collect and provide usage metrics, and the AWS Billing Console shows the cost associated with each resource.

Reference:

CSA Security Guidance v4.0, Domain 1: Cloud Computing Concepts and Architectures NIST SP 800-145 - The NIST Definition of Cloud Computing Cloud Controls Matrix (CCM) v3.0.1 - Metering and Billing Domain

NEW QUESTION # 174

What is the most effective way to identify security vulnerabilities in an application?

- A. Waiting until the application is fully developed and performing a single penetration test
- **B. Conducting automated and manual security testing throughout the development**
- C. Relying solely on secure coding practices by the developers without any testing
- D. Performing code reviews of the application source code just prior to release

Answer: B

Explanation:

The most effective way to identify security vulnerabilities in an application is to conduct automated and manual security testing throughout the development lifecycle. This approach ensures that security is continuously evaluated at every stage of development, rather than waiting until the end. Automated tools can help identify common vulnerabilities quickly, while manual testing allows for more in-depth analysis, including testing for complex, contextual security issues. This proactive and ongoing approach reduces the risk of vulnerabilities being overlooked and helps ensure that security is integrated into the application from the start.

Performing code reviews just prior to release is valuable, but it's not comprehensive enough. Security testing should be done early and continuously, not just before release. Relying solely on secure coding practices is important but not sufficient. Even with secure coding practices, testing is essential to identify vulnerabilities.

Waiting for a single penetration test after development is not effective because waiting until the end can allow many vulnerabilities to go unnoticed during development, leaving the application exposed.

NEW QUESTION # 175

Which of the following statements best describes an identity federation?

- A. Several countries which have agreed to define their identities with similar attributes
- B. A group of entities which have decided to exist together in a single cloud
- **C. The connection of one identity repository to another**
- D. A library of data definitions
- E. Identities which share similar attributes

Answer: C
